

Please Note:

This plan reflects the preferred intelligent transportation systems (ITS) deployment strategy without explicit consideration of funding availability. Funding projections were not available at the time the plan was developed. Funding availability for deploying, operating and maintaining ITS projects will impact the extent and timing of system implementation.

This plan does not constitute a commitment by any participating agency to fund recommended ITS deployments. Funding for ITS improvements must be considered along with funding of other transportation improvements in the normal transportation planning and programming processes.

Preface

The Nashville Regional Intelligent Transportation Systems (ITS) Architecture is the product of a multi-stakeholder process involving the Federal Highway Administration, Tennessee Department of Transportation and local officials representing cities and counties in the Nashville area. Facilitated by Vanderbilt University, with consultant support provided by Gresham Smith and PB Farradyne, a stakeholder working group was formed with the goal of achieving consensus on priority ITS needs for the Nashville region as well as an appropriate plan for implementing an integrated system over a 20-year horizon. This document contains the result of that effort and should be viewed as an important reference as ITS projects are defined, funded and made operational.

As ITS technology and management practices evolve, ITS projects are initiated, and there are changes in transportation, land use and other socio-economic factors in the area, there will be a need to modify the Nashville Regional ITS Architecture. The Nashville MPO will serve as the responsible agency for maintaining and updating this information.

Glossary of Terms and Acronyms

CCTV	Closed circuit television that is used for surveillance
CV	Commercial Vehicle
FHWA	Federal Highway Administration
GPS	Global Positioning System
HAZMAT	Hazardous Materials
High-Level Freeway Surveillance	Deployment of vehicle detection and CCTV surveillance.
High-Level Surface Street Control	Traffic signal system deployment that allows remote real- time timing changes, system vehicle detection and CCTV surveillance.
ITS	Intelligent Transportation Systems
ITS Equipment Package	A grouping of ITS components that can be deployed in standalone increments.
ITS Market Package	An incremental ITS deployment package that provides a distinct transportation service (e.g., network surveillance or transit vehicle tracking).
ITS Stakeholder	A person or organization having a share or an interest in ITS.
ITS User Services	A definition of benefits that ITS can provide the transportation system user (e.g., traffic control or incident management).
Kiosks	Light structures that impart information about transit routes, traffic conditions, tourist attractions and other relevant topics.
	Level-Of-Service (LOS ratings range from A to F with A being the best LOS and F the worst)
Medium-Level Surface Street Control	Traffic signal system deployment that allows remote real- time timing changes and system vehicle detection.
MPO	Metropolitan Planning Organization
National ITS Architecture	Provides a comprehensive framework for how various ITS components can be integrated and used as a basis for developing a regional ITS architecture.
Para-Transit	On-demand transit service provider that serves rural areas, the disabled and special need passengers.

Regional ITS Architecture	Specifies how the various ITS components in a region should be integrated logically, physically and institutionally.
RTMC	Regional Transportation Management Center
TDOT	Tennessee Department of Transportation
TMC	Transportation Management Center
TOC	Traffic Control Center

Executive Summary

The Nashville Regional Intelligent Transportation Systems (ITS) Architecture was prepared to guide the implementation of ITS systems in the Nashville region, with a goal of improved system-wide traffic and incident management. The Nashville region is defined to include Cheatham, Davidson, Robertson, Rutherford, Sumner, Williamson and Wilson Counties. The time frame considered in the Plan is a 20-year horizon.

The Plan was developed through a consensus process that involved a variety of ITS stakeholders in the study area. This included representatives from the Tennessee Department of Transportation (TDOT), the Nashville Area Metropolitan Planning Organization (MPO), local traffic management agencies, emergency service providers, transit system operators, the Federal Highway Administration (FHWA), local planning agencies and other transportation stakeholders.

In conducting this effort, a systematic approach was taken that utilized nationally available information on ITS deployment along with the results of several recent ITS-related studies that have taken place in the Nashville region. This included the *Nashville Area ITS Early Deployment Plan* and the *Nashville Regional Incident Management Plan*. As an initial step, traffic performance measures were generated and user service needs were defined, leading to the selection of ITS deployment locations and market packages that would meet the priority traffic and incident management needs of the Nashville region.

Over the 20-year planning horizon, the following ITS elements are recommended for implementation in the Nashville region:

- Freeway surveillance, covering 320 centerline miles
- Surface street control and surveillance, covering 296 centerline miles
- Freeway service patrols, covering 320 centerline miles
- Construction of a regional transportation management center and nine traffic operations centers
- Use of electronic fare boxes and automated tracking on transit vehicles
- Operation of two transit management centers
- Installation of 19 transit traveler information sites
- Communications to support the private broadcast of interactive traveler information
- Communications to support regional traffic control
- Communications to improve railroad highway grade crossing safety
- Installation of ten roadside weather stations
- Communications to support emergency response/routing
- Traffic signal preemption on selected surface streets
- Implementation of a virtual data warehouse for traffic/safety information storage and transfer
- Support for traffic forecasting and demand management
- Parking facilities management in downtown Nashville

• Reversible lane management on selected surface streets

As with any major transportation initiative, ITS deployment should be implemented incrementally, both to maximize system effectiveness and to recognize limitations on available funding. With this in mind, the recommended implementation schedule was divided into three phases: 0-5 years, 5-10 years and 10-20 years. Projects were assigned to each phase based on a desire to address the most critical traffic and safety needs first.

For each phase, estimates of capital, operations and maintenance (O&M), and capital replacement costs were developed, as shown below:

	Capital	O&M	Capital Replace - ment	Total
0 to 5 Year Increment	\$42.49	\$14.65	\$0.00	\$57.14
5 to 10-Year Increment	\$30.22	\$29.20	\$0.00	\$59.42
10 to 20-Year Increment	\$58.91	\$69.18	\$36.96	\$165.05
20-Year Plan	\$131.62	\$113.03	\$36.96	\$281.61

ITS Funding Requirements

(millions of 1999 dollars) ①

① The discount rate used was 7.00%

These cost estimates are inclusive of funding requirements for the entire integrated system, recognizing that different stakeholders will be bearing the cost of different ITS components. Moreover, it includes consideration of existing and programmed ITS projects.

The approach recommended for the Nashville region assumes decentralized management and operation of ITS components that are integrated into an overall regional system. As a result, providing an ITS system that appears seamless to the traveling public becomes an important institutional challenge. To successfully implement ITS within the region, agreements must be reached between involved parties to ensure that respective roles and responsibilities are clearly understood and that a full commitment of all involved has been made.

This is considered a living document that should be updated on a regular basis to reflect changes in travel patterns, gains in local ITS knowledge and experience, advances in ITS technology, access to improved cost estimates and changes affecting funding availability. The preferred update schedule is every three years, to be consistent with the Long Range Transportation Plan updating process.

1. Objective and Scope

The objective of the Nashville Regional Intelligent Transportation Systems (ITS) Architecture is to guide implementation of ITS systems in the Nashville region, leading to efficient and effective traffic and incident management. The Nashville region was defined to include Cheatham, Davidson, Robertson, Rutherford, Sumner, Williamson and Wilson Counties. Although Cheatham and Robertson Counties are not part of the Nashville Metropolitan Planning Organization, they were included based on their geographic location and potential for ITS deployment.

The Nashville Regional ITS Architecture was developed through a consensus process that involved a variety of ITS stakeholders from the study area. This included representatives from the Tennessee Department of Transportation (TDOT), the Nashville Area Metropolitan Planning Organization (MPO), local traffic management agencies, emergency service providers, transit system operators, the Federal Highway Administration (FHWA), local planning agencies and other transportation stakeholders (see Appendix A for a complete list). The stakeholders convened monthly to develop the Plan. Stakeholders that did not attend meetings were kept informed through the distribution of detailed meeting minutes.

At the outset of this process, the stakeholders developed the following vision for how the Plan can best serve the Nashville region:

The Nashville Regional ITS Architecture will serve as a "road map" to guide in the selection, placement and implementation of ITS-related technologies in the Nashville urban area. The Architecture will serve to integrate ITS with traditional multi-modal transportation improvements for the purpose of enhancing travel mobility, safety and environmental quality. Both technical and institutional considerations will be addressed in meeting these needs. The Architecture will be the product of a consensus process, aimed at achieving compatibility and integration involving traffic control and incident management between controlledaccess highways and local streets.

The time frame considered in the Plan is a 20-year horizon. It is expected that the Plan will be reviewed and updated on a regular basis, preferably every three years to be consistent with the Long Range Transportation Plan updating process.

2. Candidate ITS Locations

Identifying areas of high traffic demand and congestion within the Nashville region was an important initial step in determining candidate locations for ITS deployment. This was accomplished by utilizing the following traffic performance measures: 1) average daily traffic volume and 2) average daily traffic volume per lane. These measures were generated for all freeways in the region, as well as key arterial roadways. Key arterial roadways were defined as those that have average daily traffic volumes exceeding 10,000 vehicles per day, provide continuity in the roadway network or are situated parallel to a freeway (for more information see Appendix B).

Average daily traffic volume provides a relative indication of the number of people that will benefit from improved efficiency, such as a reduction in nonrecurring congestion. Average daily traffic volume per lane provides a surrogate measure of congestion. As the per lane volume increases, there is a corresponding increase in the likelihood that an incident will trigger congestion.

Performance measure results are shown in Figures 2-1(a and b) and 2-2 (a and b). Figures 2-1a and 2-1b illustrate the current daily traffic volumes, with Figure 2-1a showing the entire seven county study area and Figure 2-1b providing an enlarged view of central Davidson County. Similarly, the current daily volumes per lane are shown in Figures 2-2a and 2-2b.

As expected, the higher traffic volume freeway segments occur in and around downtown Nashville. The higher traffic volume arterial roadways are also concentrated in central Nashville, but occur in some suburban locations as well. Beyond identification of high traffic demand and congested areas, these performance measures were also used to determine the phasing of ITS deployments.

3. System and User Needs

Any successful plan to deploy ITS must be responsive to system and user needs. The approach used to address these considerations was to select relevant ITS Market Packages. ITS Market Packages are defined by the National ITS Architecture (Version 3.0) as incremental ITS deployments that provide a distinct transportation service (e.g., network surveillance or transit vehicle tracking). As an example, the *Network Surveillance* Market Package provides the equipment required to collect and transmit traffic surveillance data to a transportation management center. The equipment includes traffic detectors, environmental sensors, other surveillance Market Package is one of several market packages that combine to provide *Traffic Control* as an ITS User Service. There are currently 63 ITS Market Packages contained in the National ITS Architecture.

Each ITS Market Package was evaluated by the stakeholders to determine its relevance in addressing system and user needs in the Nashville region over the next twenty years. Screening criteria consisted of ITS User Services identified as relevant for Nashville that were cited in earlier ITS planning studies^{1, 2}. The relationship between ITS User Services and the ITS Market Package concept as well as a complete list of ITS Market Packages considered by stakeholders are provided in Appendix C.

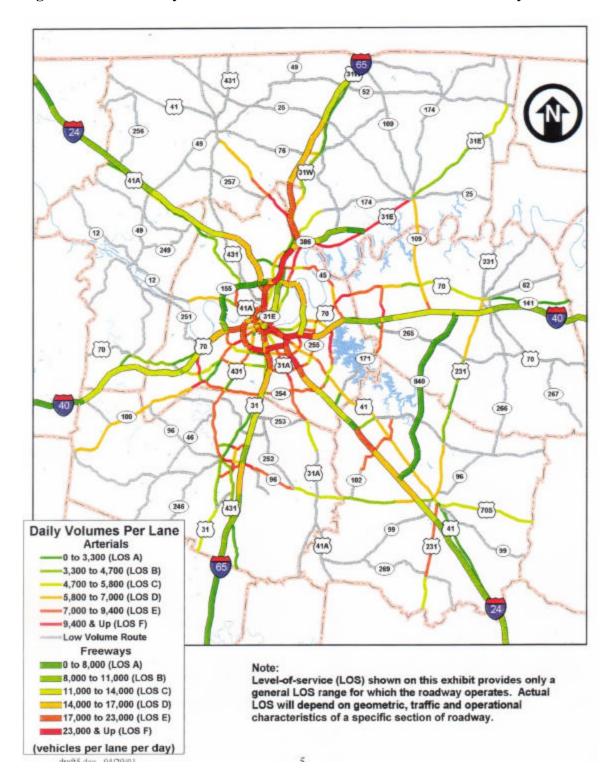

Figure 2-2a. 1999 Daily Traffic Volumes Per Lane for the Nashville Study Area

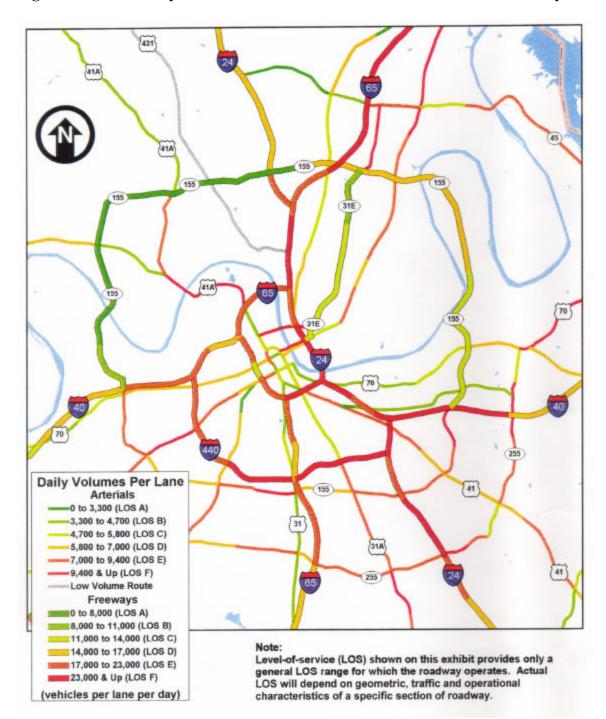

Figure 2-2b. 1999 Daily Traffic Volumes Per Lane for Central Davidson County

The ITS Market Packages selected by the stakeholders as relevant to the Nashville region in the next 20 years appear in Table 3-1.

Name	Description
Network Surveillance	This market package includes traffic detectors, environmental sensors, other
	surveillance equipment, the supporting field equipment, and wireline communications
	to transmit the collected data back to a transportation management or traffic operations
	center.
Surface Street Control	This market package provides the central control and monitoring equipment,
	communication links, and the signal control equipment that support local surface street
	control and/or arterial traffic management.
Freeway Control	This market package provides the communications and roadside equipment to support
,	ramp control, lane controls, and interchange control for freeways.
Traffic Information	This market package allows traffic information to be disseminated to drivers and
Dissemination	vehicles using roadway equipment such as dynamic message signs or highway
	advisory radio.
Regional Traffic	This market package advances the Surface Street Control and Freeway Control Market
Control	Packages by adding the communications links and integrated control strategies that
	enable integrated interjurisdictional traffic control.
Incident Management	This market package manages both predicted and unexpected incidents so that the
System	impact to the transportation network and traveler safety is minimized.
Traffic Forecast and	This market package includes advanced algorithms, processing, and mass storage
Demand Management	capabilities that support historical evaluation, real-time assessment, and forecast of the
	roadway network performance.
Standard Railroad	This market package manages highway traffic at highway-rail intersections where
Grade Crossing	operational requirements do not dictate more advanced features (e.g., where rail
-	operational speeds are less than 80 miles per hour). Both passive and active warning
	systems are supported.
Railroad Operations	This market package provides an additional level of strategic coordination between rail
Coordination	operations and traffic operations centers. Rail operations provide train schedules,
	maintenance schedules, and any other forecast events, which will result in highway-
	rail intersection closures.
Parking Facility	This market package provides enhanced monitoring and management of a parking
Management	facility. The included equipment assists in the management of parking operations,
	coordinates with transportation authorities, and supports electronic collection of
	parking fees.
Reversible Lane	This market package provides for the management of reversible lane facilities.
Management	
Road Weather	This market package monitors current and forecast road and weather conditions using
Information System	a combination of weather service information and data collected from environmental
	sensors deployed on and about the roadway.
Electronic Clearance	This market package provides for automated clearance at roadside check facilities.
CV Administrative	This market package provides for electronic application, processing, fee collection,
Processes	issuance, and distribution of CVO credential and tax filing.
Weigh-In-Motion	This market package provides for high speed weigh-in-motion with or without AVI
	attachment.
HAZMAT	This market package integrates incident management capabilities with commercial
Management	vehicle tracking to assure effective treatment of HAZMAT material and incidents.
ITS Data Mart	This market package provides a focused archive that houses data collected and owned
	by a single agency, district, private sector provider, research institution, or other
	organization.

Table 3-1. Relevant ITS Market Packages

Table 3-1. Relevant ITS Market Packages

Name	Description
ITS Virtual Data	This market package provides broad access to multimodal, multidimensional data from
Warehouse	varied data sources using enhanced interoperability between physically distributed ITS
	archives that are each locally managed.
Transit Vehicle	This market package provides for an Automated Vehicle Location System to track the
Tracking	transit vehicle's real time schedule adherence and updates the transit system's schedule
	in real-time.
Transit Fixed-Route	This market package performs automatic driver assignment and monitoring, as well as
Operations	vehicle routing and scheduling for fixed-route services.
Demand Response	This market package performs automatic driver assignment and monitoring as well as
Transit Operations	vehicle routing and scheduling for demand response transit services.
Transit Passenger and	This market package allows for the management of passenger loading and fare
Fare Management	payments on-board vehicles using electronic means.
Transit Maintenance	This market package supports automatic maintenance scheduling and monitoring. On-
	board condition sensors monitor critical system status and transmit critical status
	information to the Transit Management Subsystem.
Multi-modal	This market package establishes two-way communications between multiple transit
Coordination	and traffic agencies to improve service coordination.
Transit Traveler	This market package provides transit users at transit stops and on -board transit
Information	vehicles with ready access to transit information.
Emergency Response	This market package provides the computer-aided dispatch systems, emergency
	vehicle equipment, and wireless communications that enable safe and rapid
	deployment of appropriate resources to an emergency.
Emergency Routing	This market package supports dynamic routing of emergency vehicles and
	coordination with the Traffic Management Subsystem for special priority on the
	selected route(s).
Broadcast Traveler	This market package provides the user with a basic set of advanced traveler
Information	information services (ATIS). It involves the collection of traffic conditions, advisories,
	general public transportation and parking information and the near real time
	dissemination of this information over a wide area through existing infrastructures and
	low cost equipment (e.g., FM subcarrier, cellular data broadcast).
Interactive Traveler	This market package provides tailored information in response to a traveler request.
Information	Both real-time interactive request/response systems and information systems that
	"push" a tailored stream of information to the traveler based on a submitted profile are
	supported.
Dynamic Ridesharing	This market package enhances the Interactive Traveler Information package by adding
	infrastructure provided dynamic ridesharing capability to tailored requests for
	information regarding traffic conditions, transit services, traveler services, ride
	share/ride match, parking management, and pricing information.

4. ITS Strategies

The next step in the process involved the linking of selected ITS Market Packages to deployment scenarios. Each deployment scenario is constructed of various ITS equipment packages.

ITS equipment packages represent sets of ITS components that are deployable in standalone increments. Each ITS Market Package selected for consideration in the Nashville region over the next 20 years requires the deployment of one α more ITS equipment packages (see Figure 4-1). As an example, the *Network Surveillance* ITS

Market Package requires roadside, communications and management/control center equipment. Roadside and communications equipment is included in the freeway surveillance and the surface street control and surveillance ITS equipment packages. Center equipment is included in the regional transportation management and local traffic control center equipment packages.

Equipment Packages	Freeway Surveillance [®]	Surface Street Control and Surveillance	Freeway Service Patrol	TMC / TOC	Transit Vehicle Equipment	Transit Management Center	Transit Traveler Information	Broadcast Traveler Information	Interactive Traveler Information	Regional Traffic Control	Railroad-Highway Grade Crossings	Roadside Weather Stations	Emergency Response/Routing	Traffic Signal Preemption	Archive Data Function	Traffic Forecast and Demand Mgt. Nashville Area ITS Plan TDOT					
 Trom the 1997 Nashville Area Intelligent Transportation Systems Early Deployment Study. From 2025 Long Range Transportation Plan 					

Table 5-1. Current ITS Studies and Projects

The "Nashville MPO Area Freeway Management" and the "Nashville Area ITS Plan" projects from the 2025 Long Range Transportation Plan (see Table 5-1) do not reflect specific projects; rather they provide funding placeholders within the financially constrained plan. The current I-65 North Corridor ITS project and the development of the regional transportation management center at TDOT Region III would fall within this funding item. The "Nashville MPO Area Freeway Management" project funding level is \$120,000,000 in the 0 to 5-year time frame, while the "Nashville Area ITS Plan" designates a \$60,000,000 investment in the 5 to 10-year time frame. Total funding for local signal systems and other ITS projects in the 25-year plan is \$30,500,000.

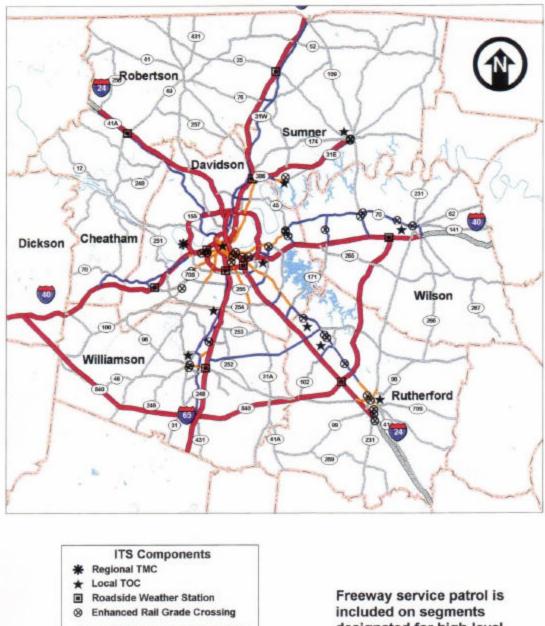

5.2 Twenty-Year Plan

The 20-year plan calls for placement of ITS equipment packages on select roadway facilities and at certain point locations. Roadway coverage includes freeway surveillance, surface street control and surveillance, and the freeway service patrol component of incident management. Figure 5-1 illustrates the extent of this roadway coverage as well as the locations of other ITS equipment packages. The following discussion provides additional details.

5.2.1 Freeway Surveillance

Over a 20-year time horizon, high-level freeway surveillance would cover 320 centerline miles of freeway in the Nashville area. This designation was based on traffic patterns apparent from the performance measure maps and general knowledge of commute patterns in the Nashville region.

Figure 5-1. 20-Year ITS Plan

designated for high-level freeway surveillance.

The high-level freeway surveillance ITS equipment package includes vehicle detection, video surveillance, dynamic message signs and a communications network. Freeway service patrol operation would cover the same freeway sections in order to minimize the effect of incidents identified by the freeway surveillance system.

Fully access controlled portions of Briley Parkway, Ellington Parkway and Vietnam Veterans Parkway (including planned extension to SR 109 in Gallatin) are included for implementation of high-level freeway surveillance along with State Route 840 from I-40 on the east to I-40 on the west. Interstate 440 is fully covered along with the radial Interstates. Interstate 40 is covered from just west of the proposed State Route 840 interchange (State Route 46 - milepost 172) to just east of Lebanon (US 70 interchange - milepost 239). Interstate 65 is covered from the Kentucky State line to just south of Franklin. Interstate 24 is covered from the State Route 256 interchange (milepost 19) in Robertson County to just south of Murfreesboro (US 231 interchange - milepost 81).

5.2.2 Surface Street Control and Surveillance

The arterial roadways designated for medium-level and high-level surface street control and surveillance (see Figure 5-1) were selected to support sections of freeway chosen for high-level surveillance or based on each local jurisdiction's plans for system enhancement. For each segment of freeway covered with high-level surveillance, an arterial roadway that is the best alternative route is designated for at least medium-level surface street control and surveillance. An upgrade to high-level was made if the local agency with jurisdiction over the parallel route indicated plans to provide video surveillance. Other arterial roadways in the region were designated for medium-level or high-level coverage based on the local agency's plan for enhancement. A total of 80 centerline miles of arterial roadway are designated to have high-level surface street control and surveillance, with 216 centerline miles of arterial roadway recommended to have medium-level surface street control and surveillance.

5.2.3 Incident Management

The primary component of incident management outside of the regional transportation management center is operation of freeway service patrols. To fully leverage the incident detection and verification benefits provided by the freeway surveillance system, freeway service patrols would be operated on all freeway segments with high-level freeway surveillance. In the 20-year plan, freeway service patrols will operate on the full 320-mile coverage of high-level freeway surveillance, as shown in Figure 5-1.

5.2.4 Transportation Management/Traffic Operations Centers

The 20-year plan includes the construction and operation of a regional transportation management center managed by the TDOT, with traffic operations centers functioning in eight local communities and at the Nashville airport (see Figure 5-2). Community traffic operations centers are planned in Brentwood, Franklin, Gallatin, Hendersonville, LaVergne, Lebanon, Metro Nashville, Murfreesboro, and Smyrna. The regional transportation management center will require the construction of a new building. It is assumed that the local traffic operations centers will be housed in existing public buildings.

5.2.5 Transit Vehicle Equipment

The Metropolitan Transit Authority (MTA) fleet used to provide fixed route service and the para-transit fleet for the region would be furnished with electronic fare boxes and the equipment required for automated vehicle tracking. It is estimated that 239 vehicles would be outfitted in this fashion based on the current size of the transit vehicle fleet. It is assumed that as the transit fleet grows, new vehicles will be equipped with the required equipment.

5.2.6 Transit Management Center

Two transit management centers are included in the Plan. One center would focus on fixed route and para-transit service in Davidson County, while the other center would manage para-transit in the area outside of Davidson County. The transit management center for Davidson County would require a building expansion, while it is assumed that the other center would not. Locations for the transit management centers have not been identified.

5.2.7 Transit Traveler Information

Within the 20-year planning period, a total of nineteen transit traveler information sites would be established. Two sites would be the Petway Transit Center and the Clement Landport. Five sites are planned for commuter rail stations and the remaining twelve would be implemented at park and ride lots (an average of two located along each radial Interstate route).

5.2.8 Broadcast/Interactive Traveler Information

Only limited broadcast and interactive traveler information would be provided by the public sector. Although the regional transportation management center and some local traffic operations centers would provide broadcast and interactive information via the Internet, it is anticipated that large-scale systems would be provided by the private sector. The regional transportation management center would provide the necessary hardware to allow private sector information service providers to access traffic data. The public sector would not subsidize this function beyond what is required to allow the private sector access to traffic data and video feeds.

5.2.9 Regional Traffic Control

Regional traffic control would be limited to sharing of information on traffic conditions and control plans. Autonomy of control would exist throughout the 20-year planning period. Coordination of traffic control for the region would be based on full communication between agencies affected by an incident. Automated or systematic regional control plans are not anticipated in the 20-year time frame.

5.2.10 Railroad-Highway Grade Crossings

ITS related railroad-highway grade crossing enhancements would focus on providing status information to the local jurisdiction that has responsibility for traffic operations on the arterial roadway affected by the grade crossing. A total of thirty-five grade crossings (see Figure 5-2) are recommended for enhancement in the 20-year planning period. This

would include an improved train detection system and equipment required to communicate grade crossing status to the local traffic operations center. Some additional hardware and software required to communicate and monitor the grade crossings would be required at the local traffic operations center.

5.2.11 Roadside Weather Stations

Roadside weather stations are recommended for installation at ten strategic locations in the Nashville region (see Figure 5-2). At present, one station exists at the I-65/I-440 interchange. The strategic locations are dispersed throughout the region at locations with major roadway structures.

5.2.12 Emergency Response/Routing

Emergency management centers and emergency vehicle equipment are not included in the Plan. It is assumed that funding to equip emergency management centers and vehicles would be obtained from sources other than transportation related funding programs. However, the regional transportation management center and the local traffic operation centers would be equipped to enable communication with emergency management centers.

5.2.13 Traffic Signal Preemption

A project programmed by Metro to provide traffic signal preemption in the vicinity of hospitals is included in the Plan.

5.2.14 Archive Data Function

The archive data function would be implemented by ITS data marts in the regional transportation management center and local traffic operations centers. Region-wide integration of archived ITS data would be provided through a virtual data warehouse system. Access to the archived data by all the data marts in the region would be provided through the virtual data warehouse.

5.2.15 Traffic Forecast and Demand Management

Hardware, software and staffing required to provide traffic forecast and demand management would be provided in the regional transportation management center.

5.2.16 Parking Facilities Management

A parking and traffic guidance system is under consideration by Metro for downtown Nashville. The system would monitor parking availability in downtown Nashville parking facilities and disseminate information to motorists via dynamic message signs. The Nashville International Airport has a parking management system in operation, but is not included in this plan because funding for the system is not from the Highway Trust Fund.

5.2.17 Reversible Lane Management

Additional reversible lanes are not expected to be implemented in the region over the next 20 years. Enhancement to reversible lane management is limited to providing the ability for Metro to remotely monitor and adjust existing reversible lane control signal systems.

5.3 Phasing of the 20-Year Plan

As with any major infrastructure or system implementation, successful ITS deployment should be implemented incrementally. Moreover, the rate of deployment must be synchronized with available funding. The phasing proposed herein assumes that the most critical problem areas would be addressed first.

Implementation of the 20-year plan is divided into three periods: 0 to 5-years, 5 to 10-years and 10 to 20-years. Figures 5-2 and 5-3 illustrate the level of ITS deployment recommended by the end of the 0 to 5-year and 5 to 10-year periods, respectively. Figure 5-2a shows the 0 to 5-year plan for the entire study area and Figure 5-2b provides an enlarged view of the 0 to 5-year plan in central Davidson County, Franklin and Murfreesboro. The phasing of each ITS equipment package is discussed in Appendix E.

6. Estimated Implementation Costs

An estimate of the cost associated with the recommended 20-year ITS deployment in the Nashville region was prepared using available unit cost data (see Appendix F). This estimate includes the projected capital, operations and maintenance (O&M), and capital replacement costs for the systems. All costs have been discounted to present dollars using a discount rate of 7 percent³. An average functional life of 10 years was used to estimate capital replacement costs. All costs are presented in 1999 dollars. Estimated costs for the three increments of the plan (first five year, second five year and last ten year increments) and the entire 20-year plan are summarized in Table 6-1.

³ The Office of Management and Budget specifies a discount rate of 7 percent to be used for benefit-cost analyses of Federal programs (OMB Circular A-94, Office of Management and Budget, October 29, 1992).

Roadside Weather Information System	\$0.32	\$0.07	\$0.10
Emergency Response/Routing	\$0.39	\$0.05	\$0.20
Archived Data Function	\$2.87	\$4.29	\$1.18
Traffic Forecast and Demand Management	\$0.40	\$3.35	\$0.00
Parking Facility Management	\$0.00	\$0.00	\$0.00
Reversible Lane Management ^③	\$0.00	\$0.00	\$0.00
Total	\$131.62	\$113.03	\$36.96

 Table 6-2. 20-Year Plan Cost Estimate Detailed Summary

 (millions of 1999 dollars)

Includes roadside information dissemination and leased communications (with TDOT owned fiber, the capital cost increases by approximately 25%)

② Approximately 30% (\$64 million) of the freeway surveillance capital cost is spent on dynamic message signs used to provide traveler information.

③ Cost for reversible lane management is included in traffic operations center costs.

A more detailed explanation of the cost estimation methodology is provided in Appendix F.

7. Integration of Regional ITS

7.1 Communications plan

A regional ITS communications study was completed for the Nashville region in 1999⁴. The purpose of this study was to develop a 10-year strategic plan for the communications system that will support regional ITS deployment. The study focused on communications needs for a freeway management system. Various communications media options and network topologies were evaluated for a state-owned network. Leasing communications from the private sector was also compared to operating a state-owned communication network.

The study concluded that the most viable communications options are leased facilities from BellSouth or installation of an optical fiber system that is owned and operated by the TDOT. The study also recommended that the lease option be used for the I-65 North project that is currently under design. The communications plan also includes a phased plan for implementing a TDOT-owned fiber optic network.

The cost estimates provided in the Nashville Regional ITS Architecture reflect the use of leased communications for the freeway surveillance system, as recommended in the communications study. If the State of Tennessee decides to develop a state owned communications network, the capital cost for freeway surveillance will increase by approximately 25 percent and annual O&M costs will be reduced by approximately 75 percent.

7.2 Location of Transportation Management/Traffic Operations Centers

As part of the I-65 North Corridor ITS design project, the location for TDOT's regional transportation management center was considered⁵. The TDOT Region III office complex was recommended as the preferred site for constructing a regional transportation management center. The study also included consideration of what functions to include in the center as well as its physical layout. It was recommended that the regional center include shared space for the Tennessee Department of Safety (State Highway Patrol), Metro police and the media.

Metro and the City of Murfreesboro have traffic operations centers that are currently in operation. Metro is planning a significant enhancement to its center in the next several years. The City of Franklin is currently in the design process for implementing a traffic operations center, to be located at Franklin City Hall.

⁴ PB Farradyne Inc. <u>Nashville Region ITS Communications Requirement Study and Strategic Plan</u>. Tennessee Department of Transportation. 1999.

⁵ Gresham Smith and Partners. <u>Location Analysis for the Nashville Regional Transportation Management</u> <u>Center</u>. Tennessee Department of Transportation. April 2000.

7.3 Regional Architecture

The regional ITS architecture specifies how various ITS equipment packages should be integrated to maximize the collective return on investment (see Section I). To be successful, this integration must address both physical and institutional considerations. The regional ITS architecture guides transportation agencies in coordinating individual ITS applications.

The Regional Architecture for Nashville identifies what information will flow between specific subsystems (e.g., regional transportation management center) and terminators (e.g., travelers), as well as the mode of communication that will be used (e.g., wireline or wireless). Institutional considerations are also presented⁶.

8. Institutional Roles and Responsibilities

ITS stakeholders in the region must work together to develop integrated ITS systems in the region. Consensus developed through working together on integration will result in several types of formal documents, which will provide guidance at various stages of ITS project implementation process. This plan is one of the formal documents, along with the multiple interagency agreements that will be produced. ITS projects must ultimately be included in the applicable regional and statewide transportation plans (long range transportation plan, TIP and STIP). To ensure that these documents are developed and remain current, responsibility for development and maintenance must be assigned.

8.1 Interagency Agreements

In order to implement an integrated ITS system, agreements must be reached between involved parties to ensure that respective roles and responsibilities are clearly understood and that a full commitment of all involved has been made. As an example, a formal agreement would be needed for data and video to be shared between the regional transportation management center and a local traffic operations center.

Deployment of ITS in a region involves unprecedented coordination among various agencies at many levels. In general, the ITS system purpose is to be responsive to traffic and incident conditions without regard to jurisdictional boundaries. Providing an ITS system that appears seamless to the traveling public becomes more challenging when it is deployed and operated in the context of decentralized functions and responsibilities. Formally defining roles and responsibilities can help eliminate battles over turf, duplication of work and delays in deployment caused by unresolved issues.

The approach recommended for the Nashville region assumes decentralized implementation of equipment packages. Individual agencies will implement their own ITS projects that must integrate into the overall system. With each agency developing

⁶ PB Farradyne, Inc. <u>Nashville Area Regional ITS Architecture</u>. Tennessee Department of Transportation. 2000.

individual systems, reaching prior agreements on interface points between systems is important. This consideration is paramount to effective communication between the regional transportation management center and the local traffic operations center and in establishing protocols for coordinated operations.

In order to maximize effectiveness, the proposed ITS system must be operated in a cooperative manner that includes the involvement of multiple State and local agencies. A series of formal agreements, such as memoranda of understanding, are recommended to establish and support a cooperative working relationship. Multiple written agreements are advisable (instead of a single document), since this provides flexibility as system operation evolves. This also prevents a change in one area from adversely impacting other areas.

Below are examples of issues that may need to be addressed in written memoranda of understanding:

- Ownership of transportation data
- Ability to distribute transportation data
- Camera control
- Jurisdiction at incidents for police, fire and rescue, and TDOT staff
- When signal timing will be modified and who can make the modifications
- How and when incident notification will occur
- When traffic can be diverted to other roadways
- Funding of capital cost
- Funding for operations
- Funding for maintenance
- Responsibility for maintenance
- Timing of system upgrades (operating systems, application software)
- Requirement for advanced notice of system upgrades
- Use of video for law enforcement
- Taping of video (liability issue)
- Responsibility for design, testing and implementation
- Staff availability (weekday 8:00 to 5:00 vs. 24-7)
- Joint statement of support for the ITS system
- Control center roles
- Field equipment ownership
- Administration and management

- Staffing
- Communication responsibilities of the TMC
- On site coordination (incident manager, call for tow trucks, etc.)
- Roles and limitations of service patrols
- Identification and management of diversion routes
- Operation of dynamic message signs and motorist information systems
- Data links between centers (CCTV, traffic counts, operating speeds, etc.)
- Control plans for recurring special events
- Control plans for unique special events
- Maintenance of traffic during construction
- Control plans for special incidents, such as HAZMAT spills

Section 9 details the ITS project implementation process, which includes checkpoints when considering the need for interagency agreements and actual agreements must be produced. Prior to a project being funded for implementation with Federal funds, interagency agreements identified as being beneficial must be completed.

8.2 Regional ITS Architecture Maintenance

An additional responsibility of all stakeholders will be periodic updating of the Nashville Regional ITS Architecture. As ITS deployment occurs, the local knowledge and experience gained, advances in technology and the availability of better cost data will influence the most cost-effective way to address traffic and safety concerns in the Nashville region.

Responsibility for maintaining the regional ITS architecture has been accepted by the MPO with assistance from TDOT. The maintaining and updating process will be facilitated by the MPO, but will require involvement of all ITS stakeholders in the process.

The ITS Regional Architecture will be formally updated just prior to the update of the Long Range Transportation Plan, now every three years. Between formal updates, new ITS project descriptions and proposed updates to the regional ITS architecture will be inserted into a Regional ITS Architecture appendix (see Appendix G). These incremental updates will be made available to other ITS stakeholders to keep them informed about what ITS projects are being planned and deployed. If all stakeholders are aware of projects that are underway, integration opportunities can be identified. The administrative procedures for initiating a new ITS project that is expected to use Highway Trust Fund money is discussed in the next section.

9. ITS Project Implementation Procedures

Planning and implementing an ITS project must occur within specific administrative procedures if Highway Trust Fund money will be used on the project at any time. Federal regulations enumerate the following policy:

ITS projects shall conform to the National ITS Architecture and standards in accordance with the requirements contained in this part. Conformance with the National ITS Architecture is interpreted to mean the use of the National ITS Architecture to develop a regional ITS architecture, and the subsequent adherence of all ITS projects to that regional ITS architecture. Development of the regional ITS architecture should be consistent with the transportation planning process for Statewide and Metropolitan Transportation Planning.- 23CFR940.5

The responsibility for determining whether ITS projects adhere to that regional ITS architecture and meet all other ITS architecture conformity regulations is delegated to the Tennessee Division of the FHWA. They also have the responsibility of determining whether or not a complete regional ITS architecture exists. The Tennessee Division has developed administrative procedures in concert with local ITS stakeholders to help in the efficient submittal, evaluation and approval of proposed ITS projects.

Submission of a project checklist form that describes the proposed ITS project is the first step in the process. The completed checklist form will provide enough information to allow a determination of what Federal regulations apply to the project and what steps are required to determine that the proposed project conforms to the regional ITS architecture or an applicable project architecture. A detailed flow chart has been developed to illustrate the steps in the process (see Appendix H). An ITS project checklist form for submittal of a project for consideration and a form for documenting regional ITS architecture modifications are also provided (see Appendix H). Review of project submittals will be by the ITS Project Review Team, which includes the FHWA ITS Engineer, MPO, TDOT and local ITS stakeholders. The Review Team will convene and review project submittals at the discretion of the Tennessee Division of the FHWA.

A determination must be made by the Review Team whether a project is an "ITS Project", whether any exceptions apply, and whether or not the project is a "Major ITS Project". If the regional ITS architecture is complete, the Review Team must determine whether the project is consistent with the architecture. When a project is determined to be inconsistent with the current regional ITS architecture, the project must be revised to be consistent with the regional ITS architecture or the regional ITS architecture must be revised.

Proposed revisions to the regional ITS architecture must be submitted to the Review Team with supporting documentation. The documentation must address why the existing ITS architecture cannot accommodate the proposed system and how the regional ITS architecture must be revised. The Review Team will determine whether the regional ITS architecture should be revised in consultation with the agency proposing the revision.

If the regional ITS architecture is not complete, a project architecture must be developed for a "Major ITS Project". Once conformity with the ITS architecture has been determined, the project must follow a normal path through the appropriate transportation planning process.

Before an ITS project is authorized by FHWA, there should be a formal review process to consider whether any interagency agreements will be beneficial in achieving integrated ITS systems. The format and nature of the agreements will depend on the significance of the interaction between agencies that is being addressed in the agreement. Interagency agreements, when deemed necessary, will be included in Appendix I of the regional ITS architecture updates to provide information on existing agreements at any given time and to provide sample agreements that can be used as a starting point for developing new agreements.

APPENDIX B

Performance Measures

Traffic performance measures were generated to help identify areas of high traffic demand and congestion within the Nashville region. The performance measures used were average daily traffic volume and average daily traffic volume per lane. These measures were produced for all freeways in the region, as well as key arterial roadways. Key arterial roadways were defined as those that have average daily traffic volumes exceeding 10,000 vehicles per day, provide continuity in the roadway network or are situated parallel to a freeway.

Freeway performance assessment included all roadways that are fully access controlled. Average daily traffic volumes for 1997 (latest available at the time the performance measures were produced) and number of lanes data were obtained from the Tennessee Roadway Information Management System (TRIMS) database. An average 3 percent per year growth rate was used to adjust traffic volumes from 1997 to 1999.

Developing performance measures for key arterial roadways was a more complex process, leading to less confidence in the performance measurements. One difficulty is the lack of complete traffic volume data, as traffic counts are made at point locations along arterial roadways, but the actual traffic volume changes at each cross street and driveway. Daily traffic volumes for arterial roadways were determined from the best available traffic count locations.

How well traffic flows on an arterial roadway is influenced by the spacing of traffic signals, the volume of traffic on cross streets at the signalized intersections and by the level of access control. No attempt was made to account for the effect of traffic signals on arterial roadways. The daily volume per lane performance measure for arterial roadways provides a relative comparison of traffic flow, but caution must be used when comparing specific roadways. As the number of traffic signals, cross street traffic volumes and number of driveways increase, there will be a lower level of traffic flow efficiency, resulting in more congestion.

It is recommended that, in future updates of the Nashville Regional ITS Architecture, forecast daily traffic volumes should be used along with existing traffic counts to develop performance measures. Current Year 2025 forecast traffic volumes were not available for consideration in this study.

APPENDIX C

ITS User Services Translation to ITS Market Packages The selection of ITS User Services relevant to the Nashville region provides a high-level inventory of transportation services that will fulfill transportation system and user needs. To refine this description of how user needs can be met, ITS Market Packages were identified that work to provide the selected ITS User Service. The stakeholders then considered the resulting subset of ITS Market Packages.

The process used to identify system and user needs utilized previous ITS planning documents, notably the *TDOT ITS Strategic Plan* and the *Nashville Area Intelligent Transportation Systems Early Deployment Study*. The *TDOT ITS Strategic Plan* is a statewide strategic plan for ITS that is updated annually by an ITS Coordinating Committee within TDOT. The *Nashville Area Intelligent Transportation Systems Early Deployment Study* was conducted from 1995 to 1997 under the direction of the Nashville Area Metropolitan Planning Organization. Both planning efforts developed a list of applicable ITS User Services for the Nashville area.

The ITS User Services are tools provided in the National ITS Architecture that are defined as follows:

User services document what ITS should do from the user's perspective. A broad range of users is considered, including the traveling public as well as many different types of system operators. The concept of user services allows system or project definition to begin by establishing the high level services that will be provided to address identified problems and needs.

Along with the ITS User Services identified in the two planning efforts, Nashville ITS stakeholders were asked to select ITS User Services they felt were applicable to the Nashville region (see Table C-1). Since the two ITS planning efforts were completed, one new ITS User Service (Archive Data User Service) has also been added to the National ITS Architecture.

In the Plan development process, only ITS Market Packages that helped provide ITS User Services selected as relevant to the Nashville region were reviewed for inclusion in the Plan. The structure of the National ITS Architecture provides a direct link between ITS User Services and ITS Market Packages. The link is a many-to-many relationship. An ITS User Service can have many ITS Market Packages that work to provide the desired service to a user; conversely, an ITS Market Package can work to provide many different ITS User Services.

Table C-1. Nashville Area User Service Matrix

Figure C-1 shows the relationship between ITS User Services and ITS Market Packages in a matrix format. This matrix is a refined version of a similar matrix provided in the *ITS Implementation Strategy*⁷ document produced in the National ITS Architecture development process. The matrix in Figure C-1 includes only ITS User Services considered relevant in the Nashville region and only the ITS Market Packages that are designed to provide those relevant

 ⁷ Lockheed Martin Federal Systems and Odetics Intelligent Transportation Systems Division. <u>ITS Implementation</u> <u>Strategy</u>. Federal Highway Administration, US Department of Transportation. Washington, D. C. September 1998.

ITS User Services. Several of the newer ITS User Services and ITS Market Packages that were not originally in the National ITS Architecture are also added to the refined matrix. All of the ITS Market Packages included in the matrix were evaluated by the stakeholders for inclusion in the Plan.

The ITS stakeholders reviewed each ITS Market Package in the subset (see Table C-2) and discussed its relevance to the Nashville region in the next 20 years. Through the review and discussion process, a list of relevant ITS Market Packages was developed. Table C-2 lists each of these ITS Market Packages along with a brief description.

Figure C-1. ITS User Service to ITS Market Package Relationship

Source: Market Packages: A Tool for Viewing, Accessing and Utilizing the National ITS Architecture, December 1999.

Table C-2. ITS Market Packages Considered

Network Surveillance (atms01) This market package includes traffic detectors, environmental sensors, other surveillance equipment, the supporting field equipment, and wireline communications to transmit the collected data back to a transportation management or traffic operations center. Probe Surveillance (atms02) This market package provides an alternative approach for surveillance of the roadway network. Two general implementation paths are supported by this market package: 1) wide area wireless communications between the vchicle and Information Service Provide is used to communicate current vchicle and roadside is used to provide equivalent information back to the Traffic Management Subsystem. Surface Street Control (atms03) This market package provides the central control and monitoring equipment, communication lines, and the signal control for freeways. Freeway Control (atms04) This market package manages HOV lanes by coordinating freeway ramp meters and connector signals with HOV lane usage signals. Management (atms05) This market package advances the Surface Street Control and Freeway Control Market Packages by adding the communications links and integrated control strategies that (atms07) Regional Traffic Incident Management Traffic Forecast and Dissemination (atms06) This market package advances the Surface Street Control and Freeway Control Market Packages by adding the communications links and integrated control strategies that (atms07) Traffic Forecast and Dissemination (atms10) This market package provides toll operators with the ability to collect tolls electronically and detect and process vighitway rafif cat highway-rafi intersections where ope	Name	Description
(atms01) surveillance equipment, the supporting field equipment, and wireline communications to transmit the collected data back to a transportation management or traffic operations center. Probe Surveillance (atms02) This market package provides an alternative approach for surveillance of the roadway (atms02) network. Two general implementation paths are supported by this market package: 1) wide-area wireless communications between the vehicle and roadside is used to provide equivalent information back to the Traffic Management Subsystem. Surface Street Control This market package provides the central control and monitoring equipment, communication links, and the signal control equipment that support local surface street control and/or arterial traffic management. Freeway Control This market package provides the contral control and monitoring equipment to support ramp control, lane controls, and interchange control for freeways. HOV Lane This market package manages HOV lanes by coordinating freeway ramp meters and connector signals with HOV lane usage signals. (atms05) This market package anages HOV lanes by coordinating freeway control Market (atms07) Regional Traffic This market package manages HOV lanes by coordinating freeway control Market (atms08) Regional Traffic This market package manages both predicted and unexpected incidents so that the system (atms08) Incident Management (atms08) This market package provides for special requirements of traral road systems. Instead of the roadway network performance.		
to transmit the collected data back to a transportation management or traffic operations center. Probe Surveillance (atms02) This market package provides an alternative approach for surveillance of the roadway network. Two general implementation paths are supported by this market package: 1) wide-area wireless communications between the vehicle and noadside is used to provide equivalent information back to the Traffic Management Subsystem. Surface Street Control This market package provides the central control and monitoring equipment, (atms03) communication links, and the signal control equipment that support local surface street control and/or arterial traffic management. Freeway Control This market package provides the communications and roadside equipment to support (atms04) ramp control, lane controls, and interchange control for freeways. HOV Lane This market package allows traffic information to be disseminated to drivers and Urkies using roadway equipment such as dynamic message signs or highway advisory radio. Regional Traffic This market package advances the Surface Street Control and Freeway Control Market Package induced advanced algorithms, processing, and mass storage capabilities that support historical evaluation, real-time assessment, and forecast of the roadway equipment soil as davanced adjorithms, processing, and mass storage capabilities that support historical evaluation, real-time assessment, and forecast of the roadway equiprements do not distate more advanced features (e.g., where rail operational systems are supported) Traffic Forecast and This market package manages bip my divide solutinths, proc		
center. Probe Surveillance (atms02) This market package provides an alternative approach for surveillance of the roadway network. Two general implementation paths are supported by this market package: 1) wide-area wireless communications between the vehicle and Information Service Provider is used to communicate current vehicle location and status, and 2) dedicated short range communications between the vehicle and roadside is used to provide equivalent information back to the Traffic Management. Subsystem. Surface Street Control (atms03) This market package provides the central control and monitoring equipment, communication links, and the signal control equipment that support local surface street control and/or arterial traffic management. Freeway Control (atms04) This market package provides the communications and roadside equipment to support ramp control, lane controls, and interchange control for freeways. HOV Lane This market package analyses HOV lanes by coordinating freeway ramp meters and connector signals with HOV lane usage signals. Traffic Information This market package allows traffic information to be disseminated to drivers and vehicles using roadway equipment such as dynamic message signs or highway advisory radio. Regional Traffic Control This market package includes advanced street Control and Freeway Control Market Packages by adding the communicational traffic control. Incident Management This market package includes advanced algorithms, processing, and mass storage capabilities that support historical evaluation, real-time assessment, and forecast of the radie traffic torecast and Demand Management (atm	(atms01)	
Probe Surveillance (atms02) This market package provides an alternative approach for surveillance of the roadway network. Two general implementation paths are supported by this market package: 1) wide-area wireless communications between the vehicle and Information Service Provider is used to communications between the vehicle and Information Service equivalent information back to the Traffic Management Subsystem. Table C-2. ITS Market Packages Considered

Name	Description
Road Weather	This market package monitors current and forecast road and weather conditions using
Information System	a combination of weather service information and data collected from environmental
(atms18)	sensors deployed on and about the roadway.
Electronic Clearance	This market package provides for automated clearance at roadside check facilities.
(cvo03)	I G I
CV Administrative	This market package provides for electronic application, processing, fee collection,
Processes (cvo04)	issuance, and distribution of CVO credential and tax filing.
Weigh-In-Motion	This market package provides for high speed weigh-in-motion with or without AVI
(cvo6)	attachment.
HAZMAT	This market package integrates incident management capabilities with commercial
Management (cvo10)	vehicle tracking to assure effective treatment of HAZMAT material and incidents.
ITS Data Mart	This market package provides a focused archive that houses data collected and owned
(ad1)	by a single agency, district, private sector provider, research institution, or other
	organization.
ITS Data Warehouse	This market package includes all the data collection and management capabilities
(ad2)	provided by the ITS Data Mart, and adds the functionality and interface definitions
	that allow collection of data from multiple agencies and data sources spanning across
	modal and jurisdictional boundaries.
ITS Virtual Data	This market package provides broad access to multimodal, multidimensional data from
Warehouse	varied data sources using enhanced interoperability between physically distributed ITS
(ad3)	archives that are each locally managed.
Transit Vehicle	This market package provides for an Automated Vehicle Location System to track the
Tracking (apts1)	transit vehicle's real time schedule adherence and updates the transit system's schedule
	in real-time.
Transit Fixed-Route	This market package performs automatic driver assignment and monitoring, as well as
Operations (apts2)	vehicle routing and scheduling for fixed-route services.
Demand Response	This market package performs automatic driver assignment and monitoring as well as
Transit Operations	vehicle routing and scheduling for demand response transit services.
(apts3)	
Transit Passenger and	This market package allows for the management of passenger loading and fare
Fare Management	payments on-board vehicles using electronic means.
(apts4)	
Transit Security	This market package provides for the physical security of transit passengers. An on-
(apts5)	board security system is deployed to perform surveillance and warn of potentially
	hazardous situations. Public areas (e.g. stops, park and ride lots, stations) are also
T 'M'	monitored.
Transit Maintenance	This market package supports automatic maintenance scheduling and monitoring. On-
(apts6)	board condition sensors monitor critical system status and transmit critical status
	information to the Transit Management Subsystem.
Multi-modal	This market package establishes two-way communications between multiple transit
Coordination (apts7) Transit Traveler	and traffic agencies to improve service coordination.
Information (apts8)	This market package provides transit users at transit stops and on-board transit vehicles with ready access to transit information.
Emergency Response	This market package provides the computer-aided dispatch systems, emergency
(em1)	vehicle equipment, and wireless communications that enable safe and rapid
	deployment of appropriate resources to an emergency.
Emergency Routing	This market package supports dynamic routing of emergency vehicles and
(em2)	coordination with the Traffic Management Subsystem for special priority on the
(01112)	selected route(s).

Table C-2. ITS Market Packages Considered

Name	Description
Mayday Support	This package allows the user (driver or non-driver) to initiate a request for emergency
(em3)	assistance and enables the Emergency Management Subsystem to locate the user and
× /	determine the appropriate response.
Broadcast Traveler	This market package provides the user with a basic set of advanced traveler
Information	information services (ATIS). It involves the collection of traffic conditions, advisories,
(atis1)	general public transportation and parking information and the near real time
	dissemination of this information over a wide area through existing infrastructures and
	low cost equipment (e.g., FM subcarrier, cellular data broadcast).
Interactive Traveler	This market package provides tailored information in response to a traveler request.
Information	Both real-time interactive request/response systems and information systems that
(atis2)	"push" a tailored stream of information to the traveler based on a submitted profile are
	supported.
Autonomous Route	This market package relies on in-vehicle sensory, location determination,
Guidance	computational, map database, and interactive driver interface equipment to enable
(atis3)	route planning and detailed route guidance based on static, stored information.
Dynamic Route	This market package offers the user advanced route planning and guidance that is
Guidance (atis4)	responsive to current conditions.
ISP Based Route	This market package offers the user advanced route planning and guidance that is
Guidance	responsive to current conditions. Different than the Dynamic Route Guidance Market
(atis5)	Package, this market package moves the route planning function from the user device
	to the information service provider.
Integrated	This market package allows a traffic management center to continuously optimize the
Transportation	traffic control strategy based on near-real time information on intended routes for a
Management/Route	proportion of the vehicles within their network while offering the user advanced route
Guidance (atis6)	planning and guidance which is responsive to current conditions.
Yellow Pages and	This market package enhances the Interactive Traveler Information package by adding
Reservation (atis7)	infrastructure provided yellow pages and reservation capabilities to tailored requests
	for information regarding traffic conditions, transit services, traveler services, ride
	share/ride match, parking management, and pricing information.
Dynamic Ridesharing	This market package enhances the Interactive Traveler Information package by adding
(atis8)	infrastructure provided dynamic ridesharing capability to tailored requests for
	information regarding traffic conditions, transit services, traveler services, ride
	share/ride match, parking management, and pricing information.
In-Vehicle Signing	This market package supports distribution of traffic and travel advisory information to
(atis9)	drivers through in-vehicle devices.
Intersection Safety	This market package will determine the probability of a collision in an equipped
Warning (avss05)	intersection (either highway-highway or highway-rail) and provide timely warnings to
	drivers in response to hazardous conditions.
Intersection Collision	This market package will determine the probability of an intersection collision and
Avoidance (avss10)	provide timely warnings to approaching vehicles so that avoidance actions can be

APPENDIX D

ITS Deployment Scenarios

Deployment scenarios were developed for each selected ITS Market Package. The deployment scenarios clarify what ITS Market Packages are expected to include when deployed in the Nashville region. The ITS Market Packages identify what transportation services are to be provided and the deployment scenarios identify how those services will be provided in the Nashville region.

Network Surveillance

The *Network Surveillance* ITS Market Package is provided by several ITS equipment packages. The Freeway Surveillance ITS equipment package provides network surveillance on the freeway portion of the transportation network. The *Surface Street Control and Surveillance* ITS equipment package provides surveillance on the arterial roadway portion of the transportation network.

The *Freeway Surveillance* ITS equipment package reflects the functional design developed in planning for ITS on the I-65 North and I-24 East freeways in Nashville⁸. Freeway surveillance will include non-intrusive vehicle detection (e.g., microwave radar detectors), continuous coverage full monition video and the communications network required to transit the data and video to the regional transportation management center.

The *Surface Street Control and Surveillance* ITS equipment packages reflect several levels of deployment. The low-level ITS equipment package is limited to collection of information by individual signalized intersection detectors on an ad hoc basis. The medium-level ITS equipment package includes placement of system detectors along arterial roadways. This system detection data would be transmitted to the local traffic operations center on a near real-time basis. The high-level ITS equipment package provides the system detection from the medium-level along with continuous coverage full motion video surveillance.

Surface Street Control

The *Surface Street Control* ITS Market Package is provided through the three *Surface Street Control and Surveillance* ITS equipment packages. The ability to adjust signal timing plans in real-time from a traffic operations center is provided under all three ITS equipment packages. The difference between ITS equipment packages relates to the level of network surveillance provided, as discussed above. All three ITS equipment packages assume that the basic traffic signal equipment exists at an intersection.

Freeway Control

The *Freeway Control* ITS Market Package considered appropriate for the Nashville region includes only ramp metering. The stakeholders also decided that ramp metering would likely not be implemented within the 20-year planning period. Although ramp meters are not expected to be implemented in the near future, the regional ITS architecture should be developed to allow ramp meters to be added when necessary.

⁸ Gresham, Smith and Partners and PB Farradyne. <u>I-65 North & I24 East Intelligent Transportation System</u> <u>Technology Review and Functional Plan Development</u>. Tennessee Department of Transportation. 1999.

Traffic Information Dissemination

The primary method of providing the *Traffic Information Dissemination* ITS Market Package is expected to be dynamic message signs. The dynamic message signs would be implemented at key decision points along freeway corridors being equipped with ITS. The dynamic message signs are considered an integral part of a freeway management system along with the *Network Surveillance* ITS Market Package components. Highway advisory radio may also be used to provide traveler information along a roadway corridor, but dynamic message signs would be the primary means. The dynamic message signs are included in the network surveillance ITS equipment package.

Regional Traffic Control

The *Regional Traffic Control* ITS Market Package involves sharing transportation network status information among transportation management and traffic operating agencies. The sharing of information will allow regional traffic control strategies to be developed and implemented on an ad hoc non-automated basis. A primary example is a local traffic operation center adjusting traffic signal timings in response to an incident on a freeway based on the sharing of information from the regional traffic control. The *Regional Traffic Control* ITS equipment package includes additional software and staffing in the transportation management center to facilitate the sharing of information.

Incident Management System

The ability to provide the *Incident Management System* ITS Market Package is dependent on the ITS Market Packages discussed to this point. The ability to collect information on incidents and implement coordinated responses is predicated on other ITS Market Packages. The *Incident Management System* ITS Market Package processes the collected information and develops the appropriate response. The *Freeway Service Patrol* equipment package is a part of the providing the *Incident Management System* ITS Market Package and is consistent with the existing freeway service patrol program operating in Nashville.

Traffic Forecast and Demand Management

The *Traffic Forecast and Demand Management* ITS Market Package is envisioned to be implemented in the latter years of the planning period. The equipment package would consist of relatively high-power computers capable of processing the advanced algorithms required for real-time traffic demand forecasting. A traffic analyst will also be required to calibrate and monitor the process. The processing unit and required staff are expected to be located in the regional transportation management center.

Standard Railroad Grade Crossing

The deployment scenario for the *Standard Railroad Grade Crossing* ITS Market Package provides equipment at the highway-railroad grade crossing for monitoring of grade crossing status. This includes monitoring of the active warning device status and of roadway vehicles trapped or blocking a crossing. This monitoring information would be transmitted to local traffic operation centers. The actual highway-railroad grade crossing warning device is not included in

this ITS equipment package. The type of warning device appropriate for a given highwayrailroad grade crossing is outside of the purview of the ITS program.

Railroad Operations Coordination

To provide the *Railroad Operations Coordination* ITS Market Package, the deployment scenario includes equipment at the local traffic operation center to monitor highway-railroad grade crossings as discussed for the *Standard Railroad Grade Crossing* ITS Market Package.

Parking Facility Management

The *Parking Facility Management* ITS Market Package deployment reflects the Traffic and Parking Guidance System being considered by Metro for downtown Nashville. Available spaces are tracked in major parking garages and the information is provided to the public via dynamic message signs.

Reversible Lane Management

The ITS equipment package for the *Reversible Lane Management* ITS Market Package is limited to providing centralized control of existing reversible lane control equipment. Since the reversible lanes are on limited sections of arterial roadways, wrong-way detection is not considered a relevant function. The only jurisdiction that currently has or expects to have reversible lanes is Metro.

Road Weather Information System

Equipment used to collect *Road Weather Information* will be deployed at strategic locations in the Nashville region. The road weather information systems collect ambient weather information and pavement temperatures that are transmitted to the transportation management center. Strategic locations will likely be major roadway structures.

Electronic Clearance

Deployment of the *Electronic Clearance* ITS Market Package is not directly included in the Plan. Electronic clearance for commercial vehicles is a statewide system currently in place. The benefits of integrating the electronic clearance system with the regional ITS system are limited at this time.

CV Administrative Processes

Deployment of the *CV Administrative Processes* ITS Market Package is not directly included in the Plan. The administrative processing for commercial vehicles is conducted on a statewide basis. The benefits of integrating the commercial vehicle administrative processing system with the regional ITS system are limited at this time.

Weigh-In-Motion

The Weigh-In-Motion ITS Market Package supports the *Electronic Clearance* ITS Market Package, thus it is not directly included in the Plan. The benefits of integrating the weigh-in-motion system with the regional ITS system are limited at this time.

HAZMAT Management

The *HAZMAT Management* ITS Market Package would be implemented through improved communication between transportation management centers and emergency management centers.

ITS Data Mart

A distributed system for *Archiving ITS Data* would be used in the Nashville region. Each agency would be responsible for data collection, verification, processing, storage and maintenance of archive data from their system. Computer equipment is required along with some type of mass storage device. Staffing to administer the data archiving process is also included in the ITS equipment package.

ITS Virtual Data Warehouse

Instead of having a comprehensive region-wide data warehouse for archiving all ITS data at one location, a *Virtual Data Warehouse* would be developed by providing access to each agency's data mart. The deployment scenario provides for archived ITS data to be accessed via the Internet.

Transit Vehicle Tracking

The *Transit Vehicle Tracking* ITS Market Package is provided through equipment onboard transit vehicles and in transit management centers. Equipment in the transit vehicle includes a global position system (GPS), an onboard computer managing data and a communications unit capable of transmitting data to the transit management center. Hardware and software in the transit management center would receive the tracking data transmitted by the transit vehicle and would manage the information.

Transit Fixed-Route Operations

The transit management center ITS equipment package provides the hardware, software and staff time necessary to provide the *Transit Fixed-Route Operations* ITS Market Package. The building that houses the transit management center is also included.

Demand Response Transit Operations

The ITS equipment package for the *Demand Response Transit Operations* ITS Market Package is similar to the deployment scenario for the *Transit Fixed-Route Operations* ITS Market Package. Hardware, software, staff time and the transit management center are included.

Transit Passenger and Fare Management

The *Transit Passenger and Fare Management* ITS Market Package ITS equipment package for the Nashville region includes equipment to implement a "smart card" system for fare payment. Electronic fare box equipment is installed on each transit vehicle. At the transit management center, hardware and software is required to process data from the electronic fare boxes.

Transit Maintenance

The ITS equipment package to provide the *Transit Maintenance* ITS Market Package is limited to hardware and software at the transit management center that automates the administrative portion of the maintenance task.

Multi-Modal Coordination

The *Multi-Modal Coordination* ITS Market Package is provided through a communication link between the transit management center and the regional transportation management center. The exchange of system status information between the management centers allows for coordination to take place between the modal agencies.

Transit Traveler Information

The ITS equipment package for providing the *Transit Traveler Information* ITS Market Package includes kiosks placed at major transit centers, such as transfer centers, park-and-ride lots and commuter rail stations. The kiosks would provide general static information and real-time transit vehicle arrival and departure times.

Emergency Response

The *Emergency Response* ITS Market Package is provided through a computer aided dispatch (CAD) system. Equipment is available within each emergency vehicle that allows data and voice communications with the emergency management center. At the emergency management center, hardware and software are provided to communicate and manage the communications with the emergency vehicles. Equipment at the emergency management center will also be provided to view video obtained from the regional transportation management center to assist in assessing the appropriate response to incidents. To allow the sharing of video, a communications link with significant bandwidth is required. Additional staffing is not required to provide this ITS Market Package, since it should improve the efficiency of the existing dispatch function.

Emergency Routing

The deployment scenario that facilitates the *Emergency Routing* ITS Market Package includes hardware and software to assist dispatchers in determining the most efficient routing to incidents requiring emergency services. The determination of most efficient routing will be based on real-time traffic flow information, so communications between the emergency management center and the regional traffic operations center is also required. In the time frame of this plan, implementing special ad hoc timing plans to facilitate emergency vehicle travel to incidents is not included. A traffic signal preemption ITS equipment package is also included in the *Emergency Routing* ITS Market Package.

Broadcast Traveler Information

The *Broadcast Traveler Information* ITS Market Package would be provided mainly through private entities, such as the existing media and traffic reporting services. Broadcast traveler information from the transportation management center would be limited to information provided on an Internet site. To facilitate the distribution of traveler information through private entities, the traffic operations center would provide access to network status data and video images.

Interactive Traveler Information

The deployment scenario for the *Interactive Traveler Information* ITS Market Package relies on private entities similar to the *Broadcast Traveler Information* ITS Market Package. Private entities would take the basic traveler information data and repackage the information customized for individual transportation system users.

APPENDIX E

ITS Plan Phasing

As with any major infrastructure or system implementation, to be successful, ITS deployment must be implemented incrementally. Moreover the rate of deployment is limited by available funding. The phasing proposed herein assumes that the most critical problem areas should be addressed first.

Implementation of the 20-year plan is divided into three periods: 0 to 5-years, 5 to 10-years and 10 to 20-years. Figures 5-2 and 5-3 illustrate the level of ITS deployment at the end of 0 to 5-year and 5 to 10-year periods, respectively. Figure 5-2a shows the 0 to 5-year plan for the entire study area and Figure 5-2b provides an enlarged view of the 0 to 5-year plan in central Davidson County, Franklin and Murfreesboro. The phasing of each ITS equipment package is discussed below.

Freeway Surveillance

Coverage of the 20-year freeway surveillance plan was prioritized into eight groups, based on applying the following criteria:

Has an Alternative Route - The two major functions of a freeway surveillance system are to facilitate enhanced incident management and to provide improved traveler information. Improved traveler information allows transportation system users to make better travel decisions. If no reasonable alternative routes are available, then a decision to take an alternative route is not viable. For the purpose of this evaluation, an alternative route is defined from the perspective of a typical Nashville commuter. The amount of out-of-direction travel and the type of roadway facility (e.g., freeway or surface street) affect the acceptability of an alternative route. In the evaluation of alternative routes, those that use freeways are considered superior to surface street alternative routes.

Is an Alternative Route - If a roadway is the primary alternative route for another freeway route that is equipped for surveillance, then surveillance of the roadway is requisite to ensure that traffic flow on the alternative route can be assessed. The utility of using an alternative route is affected by how well traffic is flowing on that alternative route. The ability to assess traffic flow on primary and alternative routes in real-time is key to an advanced traveler information system. Thus, freeway routes that serve as primary alternative routes for freeway routes being instrumented for surveillance are strong candidates for surveillance deployment.

High Volume -to-Capacity (LOS E/F) - One of the primary benefits of freeway surveillance systems is the ability to enhance incident management. Traffic related incidents are detected quicker, verified and more efficiently handled as a result of information that a freeway surveillance system provides. The objective is to resolve the incident as quickly as possible to reduce the impact on traffic flow. The impact on traffic flow is related to the ratio of traffic volume to capacity (V/C ratio). An incident reduces capacity, resulting in a higher V/C ratio. The level of service on a freeway degrades as the volume to capacity ratio increases and can become unstable, resulting in congestion as the reduced capacity nears the traffic volume being served. The closer a roadway is to capacity (high V/C ratio), the greater are the chances that an incident will cause a reduction in capacity significant enough to cause traffic congestion.

High Existing Volume - As route volumes increase, a greater number of users will experience the benefits of enhanced incident management and available traveler information. If the freeway surveillance system allows an incident to be removed sooner, resulting in a reduction in travel time, the reduction in delay will be experienced by each user passing the incident during the time while the reduced delay is experienced. A higher volume roadway will have a greater number of users passing the incident location in the same period of time. The higher the volume, the larger the number of motorists that can benefit from traveler information that is provided.

The freeways in the Nashville region were divided into segments to apply these criteria. The break points for freeway segments were at all system interchanges and at some service interchange locations along sections of freeway where the spacing between system interchanges exceeds 5 miles.

Figure E1 summarizes the assignment of priority rankings to routes using the characteristics discussed above. The "Has An Alternative Route" criteria rating reflects the quality of the best alternative route. Freeway segments with alternative freeway routes were considered superior. The rating for serving as an alternative route is based on the number of situations in which a freeway segment would serve as an alternative route. In order to differentiate freeway segments based on traffic volumes, freeway segments were ranked from highest to lowest daily volume and subdivided into quartiles.

Figure E-1. Freeway Segment Prioritization

◆ - Fully meets criteria, ◇ - Partially meets criteria, ① Alternative route, ② Currently under design

The following summary explains the assignment of freeway segments to each priority group:

Priority 1 - The highest priority freeway segments have alternative routes that are freeways, act as an alternative route for a significant number (> 3) of other freeways segments, have an existing planning analysis LOS of E or F and fall in the upper-half of total volume ranking. In order to maximize the benefits accruing from deployment of surveillance on these highest priority freeway segments, freeway segments that act as alternative routes for these segments are also included as Priority 1. The portion of the I65 North ITS Project north of the downtown loop is included in Priority 1 since it is a programmed project.

Priority 2 includes the remaining freeway segments that have good alternative freeway routes.

Priority 3 includes the remaining freeway segments that have alternative freeway routes that are not as advantageous to all users. Some longer distance travelers will use the alternative freeway routes, but many local commuters will use surface streets as alternative routes because of the amount of out-of-direction travel required using the alternative freeway route.

Priority 4 includes freeway segments without reasonable alternative freeway routes that have an existing planning analysis LOS of E or F and fall in the upper quartile of total volume rankings.

Priority 5 includes the remaining freeway segments in the upper-half of the daily volume rankings.

Priority 6 freeway segments are those that fall in the second to the lowest quartile of the daily volume rankings.

Priority 7 freeway segments are in the lowest quartile of total volume rankings and serve commuter traffic.

Priority 8 freeway segments are in the lowest quartile of total volume rankings and serve primarily traffic bypassing Nashville.

Figure E-2 illustrates the resulting priority groupings of freeway and primary arterial roadway segments on a regional map.

The stakeholders agreed to assign priority groups 1 and 2 to the first five years of the plan and priority groups 3, 4 and 5 to the next five years of the plan. The remaining priority groups (6, 7 and 8) are to be considered for implementation in years 10 through 20 of the plan.

Surface Street Control and Surveillance

Phasing for surface street control and surveillance depended on the phasing of freeway segments when the arterial roadway serves as an alternative route or on the plans of the local jurisdiction. An arterial roadway that serves as a primary alternative route would have medium-level surface street control and surveillance applied when the adjacent freeway is equipped with surveillance. A local jurisdiction's plans to provide high-level surveillance or medium-level surveillance to an arterial roadway that does not serve as a primary alternative route for a freeway dictates other deployment phasing. Figure E2 shows the phasing of arterial roadways that serve as primary alternative routes for freeways.

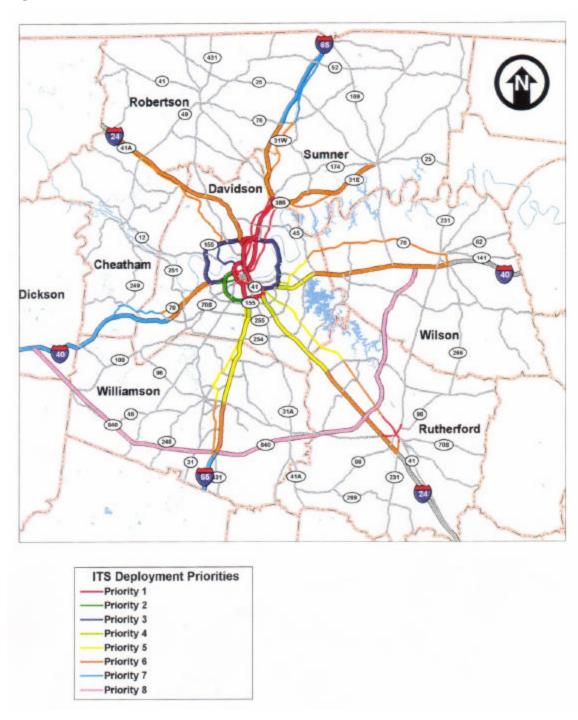

Figure E-2. 20-Year Network Surveillance Plan Prioritization

Incident Management

The primary incident management ITS component, freeway service patrols, would be deployed as freeway sections are equipped for surveillance. Deploying the freeway service patrols to the freeway segments with surveillance will maximize the benefits from reduced nonrecurring congestion that result from enhanced incident detection, verification and response. Existing freeway service patrol coverage will not be reduced. Other incident management components would be deployed in the transportation management center.

Transportation Management/Traffic Operations Centers

The regional transportation management center would be built as part of the first freeway surveillance project. Local traffic operations centers would be implemented when local jurisdictions have them planned or as surface street control and surveillance is planned on arterial roadways in a jurisdiction. In the 0 to 5-year period, Metro and Franklin would implement enhanced or new traffic operations centers. In the 5 to 10-year period Brentwood and the Nashville Airport would implement traffic operation centers and in the 10 to 20-year period Gallatin, Hendersonville, LaVergne and Symrna would implement centers. The City of Murfreesboro has an existing traffic operations center.

Transit Vehicle Equipment

The transit vehicle equipment consists of two ITS equipment packages. The first package facilitates electronic fare payment and management, while the other provides the components for automated vehicle location. In the 0 to 5-year time frame, the MTA fleet (140 fixed route buses and 33 para-transit vehicles) would be equipped with electronic fare boxes. Also in the 0 to 5-year time frame, MTA's para-transit fleet (33 vehicles) would be equipped with automated vehicle location components. In the 5 to 10-year time frame, the MTA fixed route buses (140 vehicles) would be equipped for automatic vehicle location. In the 10 to 20-year time frame, the para-transit fleet (66 vehicles) providing service to the outlying counties would be equipped with electronic fare boxes and automatic vehicle location equipment. It is assumed that when the transit fleet is increased, new vehicles will be equipped with the required packages.

Transit Management Center

Enhancement of MTA's current dispatch center to create a transit management center is anticipated in the 5 to 10-year period. Along with the required equipment, software and staffing for the transit center, a 500 square foot building expansion is included. Creation of a transit management center for para-transit outside of Davidson County is planned for the 10 to 20-year time frame.

Transit Traveler Information

Deployment of transit traveler information kiosks is planned for the 5 to 10-year and the 10 to 20-year time frames. In the 5 to 10-year period a kiosk will be placed at the Petway Transit center, the Clement Landport and five commuter rail stations. In the 10 to 20-year period, kiosks will be located at twelve park-and-ride lots.

Broadcast and Interactive Traveler Information

The limited broadcast traveler information equipment that will be provided by public agencies will be implemented when each respective transportation management or traffic operations center is developed.

Regional Traffic Control

Since regional traffic control consists primarily of integrated communications between transportation management and traffic operations centers, this package would be phased-in as the number of traffic operations centers increases. It is assumed that 50 percent of the cost would be incurred in the 0 to 5-year period, 25 percent in the 5 to 10 year period and the final 25 percent in the 10 to 20-year period.

Railroad-Highway Grade Crossings

Railroad-highway grade crossing improvements would be implemented as the arterial roadways that are affected are covered by surface street control and surveillance.

Roadside Weather Stations

Roadside weather stations would be implemented when a freeway segment is equipped for surveillance.

Emergency Response/Routing

Implementation of emergency vehicle and emergency management center equipment is not within the scope of this plan. Once the transportation management and traffic operations centers are functioning, the benefits from coordination will be available along with the data required to enhance emergency response and routing.

Traffic Signal Preemption

Traffic signal preemption near hospitals in Davidson County would be implemented in the 0 to 5-year period, as planned by Metro.

Archive Data Function

The data marts would be implemented concurrent with the regional transportation management center and each local traffic operations center. The virtual data warehouse would be deployed incrementally as each transportation management or traffic operation center data mart is implemented.

Traffic Forecast and Demand Management

The ability to effectively implement the traffic forecast and demand management transportation service is limited at this time. Traffic forecast and demand management algorithms and procedures are currently in a national research and development phase. For this reason, implementation of the Traffic Forecast and Demand Management Market Package is deferred to the 10 to 20-year time frame.

Parking Facilities Management

The Downtown Parking and Guidance System will be implemented in the 0 to 5-year period, as planned by Metro.

Reversible Lane Management

The ability to communicate with the existing reversible lane control signals will be implemented as part of the Metro traffic operations center enhancement, which is planned for the 0 to 5-year time frame.

APPENDIX F

Cost Estimates

The primary source of unit cost information was the *ITS Unit Costs Database*⁹ that is maintained by the Federal Highway Administration. When a more relevant cost estimate was available, it was used. For example, the cost per mile for the F24 East ITS function design was used to estimate the cost for the freeway surveillance ITS equipment package (including roadside information dissemination). The resulting unit costs were increased by 20 percent to account for miscellaneous costs not specifically detailed, by 10 percent for contingencies and by 10 percent for engineering when it is required.

The remainder of this appendix includes the following cost estimate summaries:

APPENDIX I

Interagency Agreements

As mentioned in Section 9 of the regional architecture document, this appendix contains interagency agreements. The format and nature of the agreements will depend on the significance of the interaction between agencies that is being addressed in the agreement.

Any agreements (existing or new) required for operations, including at a minimum those affecting ITS project interoperability, utilization of ITS related standards, and the operation of the projects identified in the regional ITS architecture are required in FHWA Rule 940.9(d)4 and FTA National ITS Architecture Policy Section 5.d.4.¹⁰

Name	Modified	Added
TDOT Public Agency Access to Live Video	01-15-2003	04-22-2003
TDOT Private Agency Access to Live Video	01-29-2003	04-22-2003

The following agreements are included:

Tennessee Department of Transportation

TRAFFIC OPERATIONS PROGRAM POLICY

Effective Date:

Title: Access to Live Video

POLICY

The Tennessee Department of Transportation (TDOT) will make live video of traffic conditions from Closed Circuit Television (CCTV) available to the public. CCTV images will be supplied from the Nashville Regional Transportation Management Center (RTMC) at TDOT Region 3 Complex. The video images provided would be those selected by the RTMC Operators from the images on the traffic surveillance monitors within the RTMC and that are consistent with the objectives of traffic management.

Live video images will generally be made available upon request to other government and public agencies to better coordinate traffic management strategies on incidents and crashes, and to private news media and other companies for their use in providing traffic information to the public or their customers.

A non-exclusive access agreement is required in order for governmental and private interests to receive direct access to live video. Costs for the access connection will be determined by TDOT and paid for by the USER.

BACKGROUND

In order to gather real-time traffic condition information, TDOT is building a RTMC at the Region 3 Complex on Centennial Boulevard. The RTMC is being developed into the central collection point for freeway condition information. The RTMC support systems are being developed in ways to gather and disseminate traffic information using the latest technologies.

CCTV has proven to be a significant management and delay-reduction tool for the identification and verification of incidents and crashes, thereby enabling a proper and timely response. The sharing of video information enhances the communication of current traffic conditions, thereby aiding travelers in planning their trip times, routes, and travel mode using the latest available information. TDOT will operate and maintain the CCTV system for the purpose of enhancing response to traffic incidents on the Nashville regional freeway system. TDOT wishes to share that traffic information with other transportation operating agencies, incident response agencies and the public.

Live CCTV Video Access Agreement Between

Tennessee Department of Transportation

And

Governmental Agency Users

Tennessee Department of Transportation And Governmental Agency Users

ACCESS AGREEMENT FOR LIVE VIDEO

The effective date of this Agreement is _____.

The "Access to Live Video" is that video provided by a Closed Circuit Television (CCTV) system developed for traffic management and provided by the Nashville Regional Transportation Management Center (RTMC) which is operated by TDOT. The CCTV images will show live traffic conditions, including crashes, stalled vehicles, road hazards, weather conditions, traffic congestion, and maintenance and repair work locations.

The purpose of providing the USER with Access to Live Video is to disseminate realtime traffic information to motorists and to help improve incident management response times. The following provisions of this Agreement are provided to ensure that the CCTV system is accessed and its information used for this purpose, and this purpose alone.

The USER hereby acknowledges that other matters not addressed in this Agreement may arise after the RTMC begins operating the system. Therefore, TDOT reserves the right to make changes in this Agreement, by adding provisions, deleting provisions, and/or changing existing provisions when in TDOT's opinion circumstances require such changes be effectuated.

GENERAL INFORMATION:

1. TDOT will operate and maintain the CCTV system as a traffic management tool and, consistent with this purpose, TDOT agrees to provide the USER with Access to Live Video. TDOT does not guarantee the continuity of this access, and TDOT does not warrant the quality of any video image or the accuracy of any image or information provided. Any reliance on such images or information is at the risk of the USER.

2. TDOT will not record video images except for staff training purposes, and no videotapes will be made available to the USER under this Agreement.

3. TDOT will maintain exclusive control of the information and images released from the CCTV system to the USER, including but not limited to determining whether and when to provide a CCTV system feed, from what location, and for what duration. No feed shall focus on vehicle license plates, drivers, or other personal identification of

individuals involved in any traffic-related incident. No image shall focus on any property or person outside the TDOT right-of-way. Access via feed will not be provided for events that are not, in the opinion of TDOT personnel, traffic-related. The decision whether to activate, and upon activation to terminate the access, is exclusively at the discretion of TDOT personnel.

4. Each USER will receive the same video feed from the CCTV system as any other USER participating in this Agreement. This Agreement in no way limits or restricts TDOT from providing video information to any other potential USER.

5. TDOT reserves the right to terminate this video access program at its discretion or change the areas, times, or levels of access within the RTMC at any time.

USER'S RESPONSIBILITIES:

6. USER, through this agreement, may be allowed to control the pan, tilt and zoom capabilities of selected CCTV cameras. TDOT will maintain an override capability of these functions.

7. USER agrees not to focus on vehicle license plates, drivers, or other personal identification of individuals involved in any traffic-related incident, nor focus on any property or person outside the TDOT right-of-way. USER further agrees to access the feed only for traffic-related or emergency response activities.

8. USER may install necessary equipment at the RTMC in order to obtain the video feed; the USER is exclusively responsible for any costs related to the purchase and installation of the equipment. TDOT personnel shall determine at what location within the RTMC the equipment is to be placed, and TDOT reserves the right to inspect all installation of equipment. Under no circumstances shall the placement and installation of this equipment interfere with RTMC equipment or activities of RTMC personnel. The responsibility for the service, maintenance, and upkeep of the installed equipment is exclusively that of the USER. The USER must give RTMC personnel reasonable advance notice of any maintenance/repair visits, and RTMC personnel reserve the right to schedule such visits at a time and in such a manner so as to not interrupt or otherwise obstruct RTMC operations. USER assumes any and all liability for the cost of repair and/or other damages to TDOT's CCTV system caused in any manner by the installation. servicing or maintenance of the USER equipment or by the equipment once installed. USER staff at the RTMC shall be under the general direction of the RTMC Manager for routine conduct, privileges, and protocols within the RTMC.

9. USER shall maintain the security and integrity of the CCTV system by limiting use of the system to trained and authorized individuals, and by insuring that the system is used for the specific purpose stated in this Agreement.

10. USER agrees to move or alter, at its own expense, any of its equipment, hardware, or software, as TDOT deems necessary to accommodate future alterations, improvements, or other changes to the RTMC equipment or facilities.

11. USER accepts all risks inherent with the live video feeds, including, but not limited to, interruptions in the video feed, downtime for maintenance, or unannounced adjustments to the camera displays.

12. USER agrees to provide TDOT with a technical contact person and with a list of all USER'S owned and supplied equipment connected to the RTMC, including the basic operational capabilities of such equipment. USER shall limit calls to the RTMC for monitoring, diagnosing problems or otherwise performing any minor service on USER owned and supplied equipment.

13. USER agrees that video feed will not be used for automated traffic enforcement purposes unless it is specifically allowed by legislation.

LIABILILTY AND INDEMNITY PROVISIONS:

14. The USER agrees to defend, indemnify, and hold TDOT harmless from and against any and all liability and expense, including defense costs and legal fees, caused by the negligent or wrongful act or omission of the USER, or its agents, officers, and employees, in the use, possession, or dissemination of information made available from the CCTV system to the extent that such liability may be imposed upon TDOT, including but not limited to, personal injury, bodily injury, death, property damage, and/or injury to privacy or reputation.

15. The liability obligations assumed by the USER pursuant to this Agreement shall survive the termination of the Agreement, as to any and all claims, inclusive without limitation liability for any damages to TDOT property or for personal injury, bodily injury, death, property damage, or injury to personal reputation or privacy occurring as a proximate result of information made available from the CCTV system.

TERMINATION:

16. TDOT or USER may terminate this Agreement any time for any reason by providing written notice of termination. Instances that may warrant such termination shall be determined at the sole discretion of TDOT. Examples of actions that could warrant termination could include but not be limited to such actions as using the zoom capabilities to focus on vehicle license plates, drivers, or other personal identification of individuals involved in any traffic-related incidents, or focusing on any property or person outside the TDOT right-of-way.

17. Upon termination of this Agreement by either party, the USER shall promptly remove its equipment from the RTMC as directed by TDOT.

ACCESS AGREEMENT FOR LIVE VIDEO

The effective date of this Agreement is _____.

The "Access to Live Video" is that video provided by a Closed Circuit Television (CCTV) system developed for traffic management and provided by the Nashville Regional Transportation Management Center (RTMC) which is operated by TDOT. The CCTV images will show live traffic conditions including crashes, stalled vehicles, road hazards, weather conditions, traffic congestion, and maintenance and repair work locations.

The purpose of providing the USER with Access to Live Video is to disseminate realtime traffic information to motorists. The following provisions of this Agreement are intended to ensure that the CCTV system is accessed and its information used for this purpose, and this purpose alone.

The USER hereby acknowledges that other matters not addressed in this Agreement may arise after the RTMC begins operating the CCTV system. Therefore, TDOT reserves the right b make changes in this Agreement, by adding provisions, deleting provisions, and/or changing existing provisions when in TDOT's opinion circumstances require such changes.

GENERAL INFORMATION:

1. TDOT will operate and maintain the CCTV system as a traffic management tool and, consistent with this purpose, TDOT agrees to provide the USER with Access to Live Video. TDOT does not guarantee the continuity of this access, and TDOT does not warrant the quality of any video image or the accuracy of any image or information provided. Any reliance on such images or information is at the risk of the USER.

2. TDOT will not record video images except for staff training purposes, and no videotapes will be made available to the USER under this Agreement.

3. TDOT will maintain exclusive control of the information and images released from the CCTV system to the USER, including but not limited to determining whether and when to provide a CCTV system feed, from what location, and for what duration. No feed will deploy the cameras' zoom capabilities, and no image will focus on vehicle license plates, drivers, or other personal identification of individuals involved in any traffic-related incident. No image will focus on any property or person outside the TDOT right-of-way. Access via feed will not be provided for events that are not, in the opinion

of TDOT personnel, traffic-related. The decision whether to activate, and upon activation to terminate the access, is exclusively at the discretion of TDOT personnel.

4. RTMC personnel will not accept requests that specific CCTV cameras be operated or that cameras be repositioned.

5. Each USER will receive the same video feed from the CCTV system as any other USER participating in this Agreement. This Agreement in no way limits or restricts TDOT from providing video information to any other potential USER.

6. TDOT reserves the right to terminate this video access program or to change the areas, times, or levels of access within the RTMC at any time.

USER'S RESPONSIBILITIES:

7. USER may install necessary equipment at the RTMC in order to obtain the video feed; the USER is exclusively responsible for any costs related to the purchase and installation of the equipment. TDOT personnel shall determine at what location within the RTMC the equipment is to be placed, and TDOT reserves the right to inspect all installation of equipment. Under no circumstances shall the placement and installation of USER's equipment interfere with RTMC equipment or activities of RTMC personnel. The responsibility for the service, maintenance, and upkeep of the installed equipment is exclusively that of the USER. USER must give RTMC personnel reasonable advance notice of any maintenance/repair visits, and RTMC personnel reserves the right to schedule such visits at a time and in such a manner so as to not interrupt or otherwise obstruct RTMC operations. USER assumes any and all liability for the cost of any repair and/or other damages to TDOT's CCTV system caused in any manner by the installation, servicing or maintenance of the USER's equipment or by the equipment once installed. USER staff at the RTMC shall be under the general direction of the RTMC Manager for routine conduct, privileges, and protocols within the RTMC.

8. USER shall maintain the security and integrity of the CCTV system by limiting use of the system to trained and authorized individuals, and by insuring the system is used for the specific purpose stated in this Agreement. No feed shall be purposely broadcast live or rebroadcast that is zoomed in on an accident where individuals or license numbers are recognizable.

9. USER agrees to move or alter, at its own expense, any of its equipment, hardware, or software, as TDOT deems necessary to accommodate future alterations, improvements, or other changes to the RTMC equipment or facilities.

10. USER accepts all risks inherent with the live video feeds, including, but not limited to, interruptions in the video feed, downtime for maintenance, or unannounced adjustments to the camera displays. TDOT is providing the video feeds as a convenience to the private media company and agrees to provide a good faith effort to maintain the video feed from TDOT equipment. The USER agrees to hold TDOT harmless, including

TDOT employees and TDOT-designated agents, from any damages caused by loss of a video signal due to equipment failure or any unintentional act on their part.

11. USER agrees to provide TDOT with a technical contact person and with a list of all USER's owned and supplied equipment connected to the RTMC, including the basic operational capabilities of such equipment. USER shall limit calls to the RTMC for monitoring, diagnosing problems or otherwise performing any minor service on USER owned and supplied equipment.

12. The User agrees to acknowledge the video images are provided by the Tennessee Department of Transportation.

LIABILITY AND INDEMNITY PROVISIONS:

13. The USER agrees to defend, indemnify, and hold TDOT harmless from and against any and all liability and expense, including defense costs and legal fees, caused by any negligent or wrongful act or omission of the USER, or its agents, officers, and employees, in the use, possession, or dissemination of information made available from the CCTV system to the extent that such expenses or liability may be incurred by TDOT, including but not limited to, personal injury, bodily injury, death, property damage, and/or injury to privacy or reputation.

14. The liability obligations assumed by the USER pursuant to this Agreement shall survive the termination of the Agreement, as to any and all claims including without limitation liability for any damages to TDOT property or for injury, death, property damage, or injury to personal reputation or privacy occurring as a proximate result of information made available from the CCTV system.

TERMINATION:

15. TDOT or USER may terminate this Agreement at any time for any reason by providing notice of termination.

16. Upon termination of this Agreement by either party, the USER shall promptly remove its equipment from the RTMC as directed by TDOT.

APPENDIX J

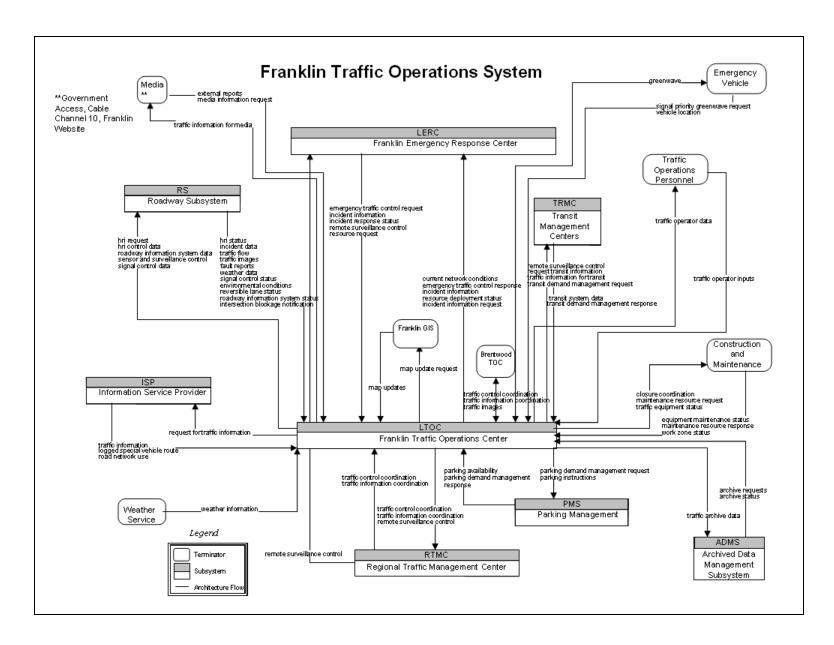

Architecture Diagrams, Information Flows and Standards

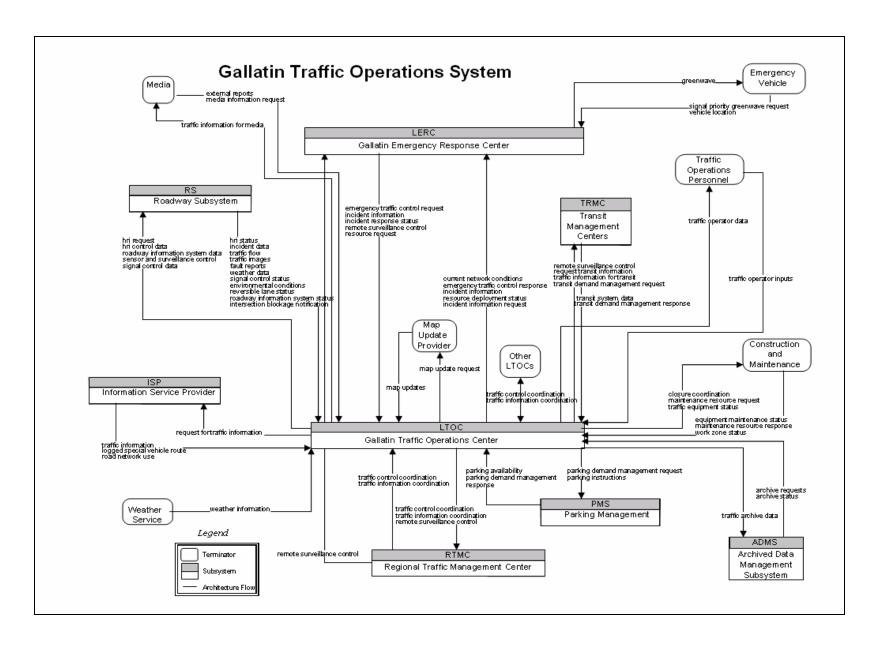

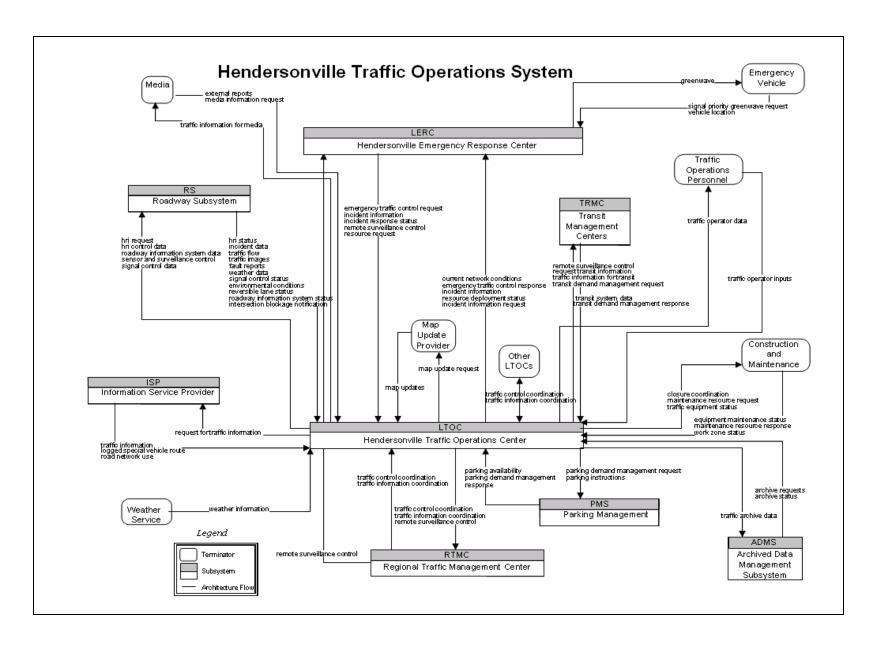

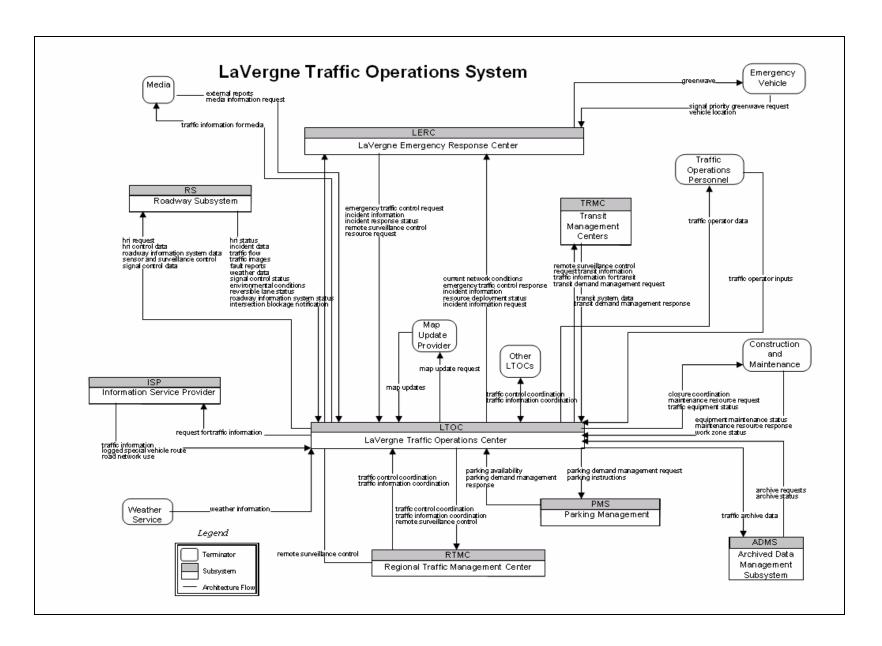

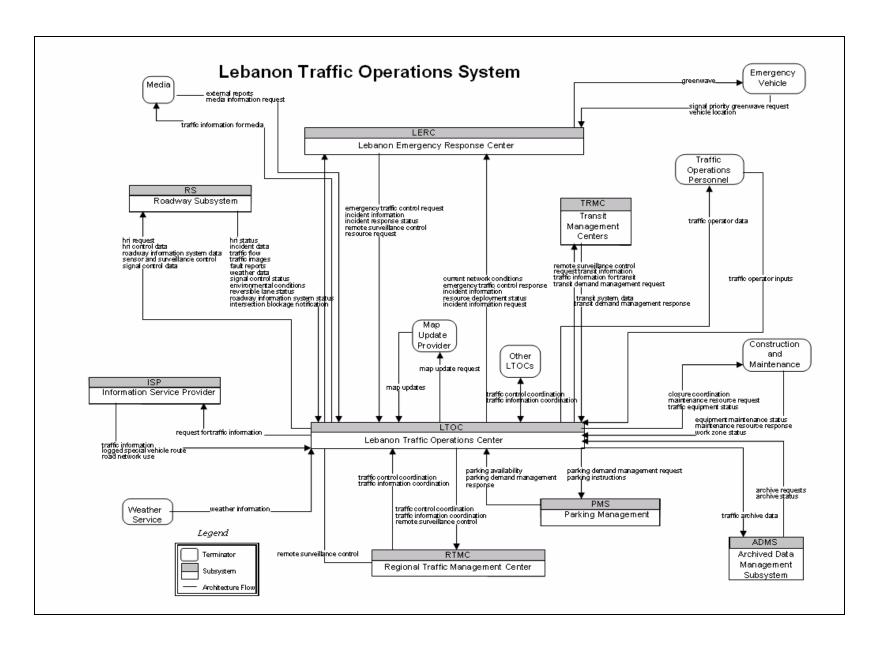

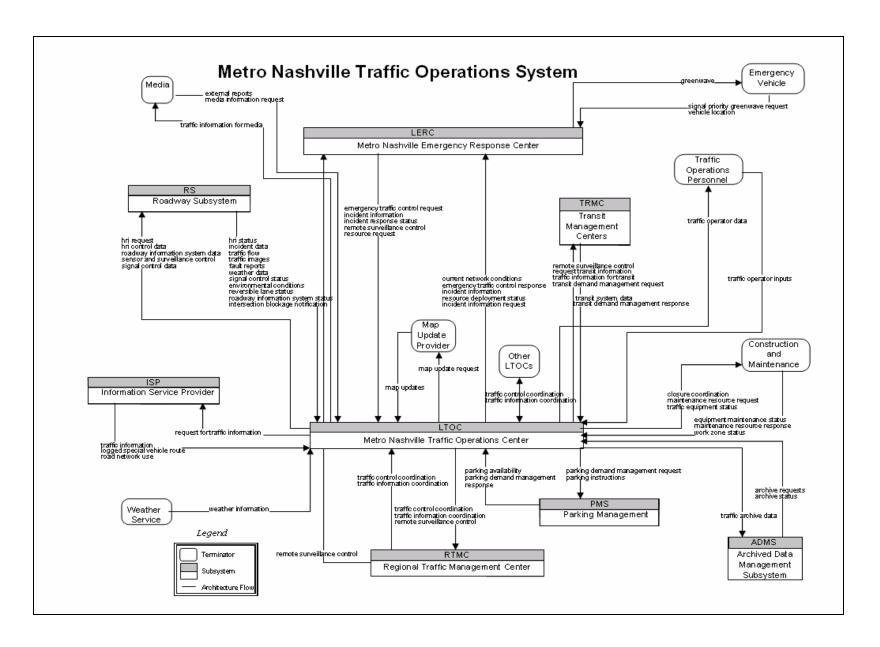

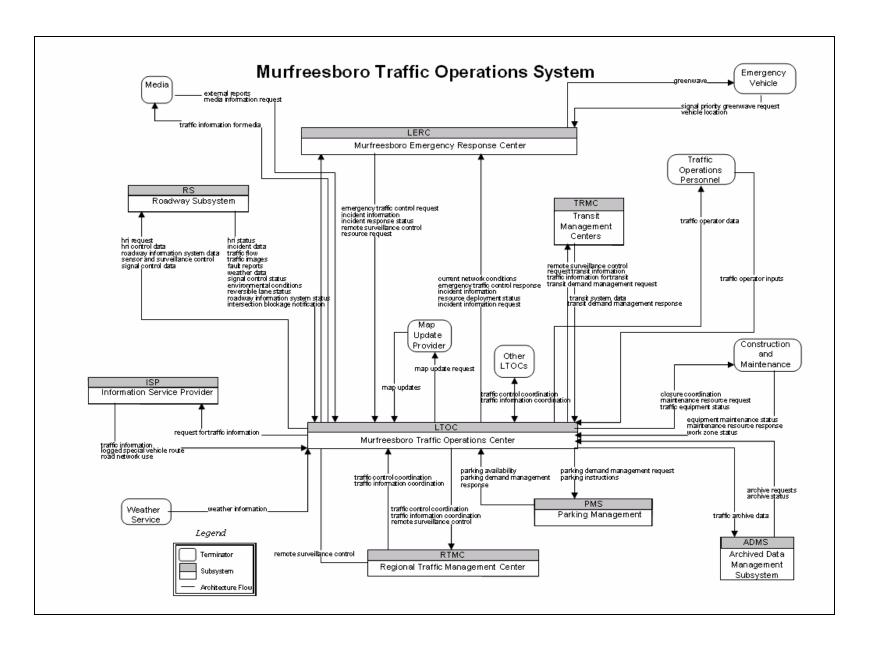

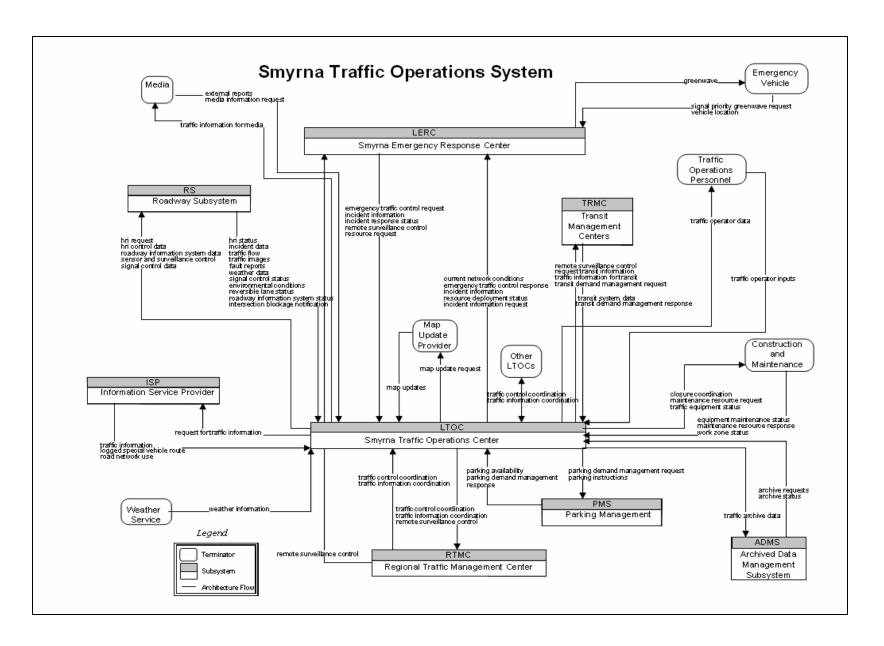

The following table lists each of the data flows included in the Nashville Regional physical architecture and describes the interfaces that will occur at the initiating and receiving ends of that data flow. The interface is described by a frequency of information interchange and the requirements for a standard protocol to conduct that interchange of data.

The protocol requirements are based on the message type and frequency. Any system command or control will occur in real time and a stable protocol will be required. US DOT is recommending any appropriate standards federally funded for ITS deployment such as the National Transportation Communications for ITS Protocol (NTCIP). Therefore, all five systems in the Nashville Region will be designed for NTCIP (or an equivalent federally adopted standard) compliance of individual elements, based on the maturity of specifications.

There are numerous additional messages that communicate information among the terminators within a subsystem in real time. NTCIP is recommended, although not required, for these communications. There are other messages that are sent with subsystems that will not occur in real time. NTCIP is optional for these non-real time messages. There are other messages to be sent via basic communications media such as telephone, pager, fax, Internet, radio broadcast or television broadcast. These communications do not need any transportation-related protocols.

In general, when a standard is required, this generally means that real-time control is involved, such as surveillance. Life safety may be at stake therefore the standard is categorized as being required.

A recommended standard indicates that data is passed between agencies and those receiving the data should have a common base for understanding its meaning. This is not a control standard, nor is it an issue of life safety.

Standards listed as optional relinquish the decision to those establishing the architecture flow. Communication may be easier with the local standard but it is not necessarily in real-time. Lastly, if no protocol category is listed, no standard currently available is applicable or needed.

There are three types of exchange frequency used in the interface descriptions.

System command/control – Information transfer is between a terminator and a subsystem.

Daily periodic in real time – Information transfer occurs regularly in actual time

Daily periodic not real time – Information transfer occurs regularly but not necessarily relayed immediately.

In all cases, the protocol suggested is currently in development and adoption phases of the ITS Standards process. Therefore it is possible that a local standard may need to be adopted in the early stages of the Nashville ITS development and a migration plan be implemented to use the National or International Standard when it is in place. In a migration plan, standards suggested in this section may change as they become standards adopted by the USDOT. The suggested standards will need to be updated to correspond with those regulations. The Intelligent Transportation Systems (ITS) program has placed emphasis on developing national standards for communications. Several standards organizations have been tasked to develop the communications between systems and subsystems.

- National Transportation Communications for ITS Protocol (NTCIP) NTCIP development began with the traffic control industry recognizing the need to extend existing standards to include systems interoperability and communications issues. The NTCIP effort is focused on developing communications protocols necessary to "command and control" various ITS devices (DMS, CCTV, traffic signal controllers, etc.).
- Advanced Traffic Management Systems Data Dictionary (TMDD) TMDD provides unique definition and description of the data elements used in "sharing" data between systems.
- Advanced Traveler Information System (ATIS) ATIS protocol development focuses on developing standardized message sets used in disseminating traveler information.
- *Transit Communications Interface Profiles (TCIP)* TCIP focuses on developing standards for transit communications to various systems.
- Commercial Vehicle Information Systems and Networks (CVISN) CVISN refers to a collection of information systems and communications networks to support commercial vehicle operations (CVO). The FHWA CVISN program focuses on creating new ways for existing and newly designed systems to exchange information. A component of the CVO part of the National ITS Architecture, CVISN includes standards for communications technologies.
